David Bova	Community Development Admin	Administration	City of Ste. Genevieve
Paul Taylor	Assistant Superintendent	Administration	Ste. Genevieve R-II School Dist.
Chris Kertz	Director	Administration	Levee District 2
Norman Gallup	Director	Administration	Levee District 3

#### Stakeholder Representatives

Name	Title	Department	Agency/Organization
Sandra Bell	Director	Administration	Ste. Genevieve County Health Dept.
Tom Keim	CEO	Administration	Ste. Genevieve County Memorial Hospital
Eric Bennett	Chief	Police Department	City of Ste. Genevieve
Ken Steiger	Chief	Fire Department	City of Ste. Genevieve
Gary Stolzer	Sheriff	Sheriff's Department	Sheriff's Department
Alan Wells	Director	911 Operations	Ste. Genevieve County 911
Capt. Stephen Ferrier	Commanding Officer	Administration	MSHP Region C
Van Robinson	CEO	Administration	Citizens Electric Cooperative

Steve Besemer	Regional Coordinator	Communications	Missouri State Emergency Management Agency
Art Goodin	Director	Southeast Regional Office	Missouri Department of Natural Resources
Leslie Sebaugh	Coordinator	Regional Homeland Security Oversight Committee	SEMO Regional Planning Commission
Rebecca Pecaut	Coordinator	Solid Waste Management District	SEMO Regional Planning Commission
Maria Stevenson	Executive Director	Administration	American Red Cross - Southeast Missouri Chapter
Brian Okenfuss	Area Engineer	Engineering & Design	Missouri Department of Transportation

Stakeholders are individuals or groups that are affected by a mitigation action or policy and include businesses, private organizations, and citizens. Unlike planning team members, stakeholders may not be involved in all stages of the planning process, but they inform the planning team on a specific topic or provide input from different points of view in the community. Many of the Stakeholders and Jurisdictional Representatives listed above provided feedback, input, and information through discussions over the phone, emails, or in-person, but were not in attendance at Hazard Mitigation Planning Team meetings.

## EXECUTIVE SUMMARY

---

The purpose of hazard mitigation is to reduce or eliminate long-term risk to people and property from hazards. Ste. Genevieve County and participating jurisdictions and school/special districts developed this multi-jurisdictional local hazard mitigation plan update to reduce future losses from hazard events to the County and its communities and school/special districts. The plan is an update of a plan that was approved on August 22, 2013. The plan and the update were prepared pursuant to the requirements of the Disaster Mitigation Act of 2000 to result in eligibility for the Federal Emergency Management Agency (FEMA) Hazard Mitigation Assistance Grant Programs.

The County Multi-Hazard Mitigation Plan is a multi-jurisdictional plan that covers the following jurisdictions that participated in the planning process:

- Unincorporated Ste. Genevieve County
- City Bloomsdale
- City of St. Mary
- City of Ste. Genevieve
- Ste. Genevieve R-II School District
- Levee District No. 2
- Levee District No. 3

Ste. Genevieve County and the entities listed above developed a Multi-Jurisdictional Hazard Mitigation Plan that was approved by FEMA on October 6, 2014 (hereafter referred to as the *2014 Hazard Mitigation Plan*). This current planning effort serves to update that previously approved plan.

The plan update process followed a methodology prescribed by FEMA, which began with the formation of a Hazard Mitigation Planning Committee (HMPC) comprised of representatives from Ste. Genevieve County and participating jurisdictions. The HMPC updated the risk assessment that identified and profiled hazards that pose a risk to Ste. Genevieve County and analyzed jurisdictional vulnerability to these hazards. The HMPC also examined the capabilities in place to mitigate the hazard damages, with emphasis on changes that have occurred since the previously approved plan was adopted. The HMPC determined that the planning area is vulnerable to several hazards that are identified, profiled, and analyzed in this plan. Riverine and flash flooding, winter storms, severe thunderstorms/hail/lightning/high winds, and tornadoes are among the hazards that historically have had a significant impact.

Based upon the risk assessment, the HMPC chose to keep the previous goals for reducing risk from hazards. The goals are listed below:

1. Protect the health, safety, and welfare of residents and students.
2. Ensure the operation of critical facilities and services.
3. Protect public and private property.
4. Enhance informed decision making of mitigation actions.

To advance the identified goals, the HMPC developed recommended mitigation actions, which are detailed in Chapter 4 of this plan. The HMPC developed an implementation plan for each action, which identifies priority level, background information, ideas for implementation, responsible agency, timeline, cost estimate, potential funding sources, and more.

---

## PREREQUISITES

This plan has been reviewed by and adopted with resolutions or other documentation of adoption by all participating jurisdictions and special districts. The documentation of each adoption is included in Appendix A, and a model resolution is included on the following page.

The following jurisdictions participated in the development of this plan and have adopted the multi-jurisdictional plan.

- Unincorporated Ste. Genevieve County
- City Bloomsdale
- City of St. Mary
- City of Ste. Genevieve
- Ste. Genevieve R-II School District
- Levee District No. 2
- Levee District No. 3

**Model Resolution**

Resolution # \_\_\_\_\_

Adopting the Ste. Genevieve County Multi-Jurisdictional Local Hazard Mitigation Plan

**Whereas**, the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) recognizes the threat that natural hazards pose to people and property within our community; and

**Whereas**, undertaking hazard mitigation actions will reduce the potential for harm to people and property from future hazard occurrences; and

**Whereas**, the U.S. Congress passed the Disaster Mitigation Act of 2000 (“Disaster Mitigation Act”) emphasizing the need for pre-disaster mitigation of potential hazards;

**Whereas**, the Disaster Mitigation Act made available hazard mitigation grants to state and local governments; and

**Whereas**, an adopted Local Hazard Mitigation Plan is required as a condition of future funding for mitigation projects under multiple FEMA pre- and post-disaster mitigation grant programs; and

**Whereas**, the (Name of Government/District/Organization) fully participated in the hazard mitigation planning process to prepare this Multi-Jurisdictional Local Hazard Mitigation Plan; and

**Whereas**, the Missouri State Emergency Management Agency and the Federal Emergency Management Agency Region VII officials will review the “County A Multi-Jurisdictional Local Hazard Mitigation Plan,” and approved it as to form and content; and

**Whereas**, the (Name of Government/District/Organization) desires to comply with the requirements of the Disaster Mitigation Act and to augment its emergency planning efforts by formally adopting the Ste. Genevieve County Multi-Jurisdictional Local Hazard Mitigation Plan; and

**Whereas**, adoption by the governing body for the (Name of Government/District/Organization) demonstrates the jurisdictions’ commitment to fulfilling the mitigation goals outlined in this Multi-Jurisdictional Local Hazard Mitigation Plan; and

**Whereas**, adoption of this legitimizes the plan and authorizes responsible agencies to carry out responsibilities under the plan;

**Now, therefore, be it resolved**, that the (Name of Government/District/Organization) has adopted the “Ste. Genevieve County Multi-Jurisdictional Local Hazard Mitigation Plan” as an official plan.

# 1 INTRODUCTION AND PLANNING PROCESS

<b>1 INTRODUCTION AND PLANNING PROCESS</b> .....	<b>1</b>
1.1 Purpose.....	1
1.2 Background and Scope.....	1
1.3 Plan Organization.....	2
1.4 Planning Process.....	3
1.4.1 Multi-Jurisdictional Participation.....	4
1.4.2 The Planning Steps.....	5

## 1.1 Purpose

---

The purpose of hazard mitigation is to reduce or eliminate long-term risk to people and property from hazards. Hazard mitigation is generally considered to be the actions taken well in advance of a disaster event. Actions taken immediately prior to or during an event or immediately following an event are typically considered response and recovery actions, respectively. This plan has been developed to assist participating jurisdictions in identifying potential hazard exposures and defining actions that can limit such.

For jurisdictions to be eligible for federal Hazard Mitigation Grants, they must participate in this planning process and adopt the plan by resolution. Any jurisdictions that do not participate will be ineligible for such grants until the next plan update is undertaken. This plan is viable for five (5) years from the date of FEMA approval.

For additional information about the Hazard Mitigation Planning Process, please refer to: the Disaster Mitigation Act of 2000 (Public Law 106-390) and the implementing regulations set forth by the Interim Final Rule published in the Federal Register on February 26, 2002, (44 CFR §201.6) and finalized on October 31, 2007 (hereafter referred to collectively as the Disaster Mitigation Act or DMA) and the Robert T. Stafford Disaster Relief and Emergency Act (Public Law 93-288).

## 1.2 Background and Scope

---

This hazard mitigation plan (HMP) is an update to the 2014 Ste. Genevieve County HMP which was approved by FEMA on October 6, 2014. This plan is valid for a period of five years and will undergo a full update cycle in 2025.

The following table provides a list of participants during this plan update.

---

**Table 1.1. Plan Participants**

Jurisdiction	NFIP Participant	Participating Jurisdiction (2014)	Participating Jurisdiction Criteria (2020)				Participating Jurisdiction (2020)
			Meetings Attended	Actions Developed	Draft Reviewed	Formal Adoption	
Ste. Genevieve County	Y	X	X	X	X	X	X
Bloomdsdale	N	X	X	X	X	X	X
St. Mary	Y	X	X	X	X	X	X
City of Ste. Genevieve	Y	X	X	X	X	X	X
Ste. Genevieve R-II School Dist.	N/A	X	X	X	X	X	X
Levee Dist. No. 2	N/A		X	X	X	X	X
Levee Dist. No. 3	N/A		X	X	X	X	X

Information in this plan will be used to help guide and coordinate mitigation activities and decisions for local land use and development policy in the future. Actions from this plan will also be incorporated into local jurisdiction's other planning efforts as appropriate.

### 1.3 Plan Organization

---

This HMP is organized into 5 main chapters, along with an executive summary and appendices, as follows:

- Executive Summary
- Chapter 1: Introduction and Planning Process
- Chapter 2: Planning Area Profile and Capabilities
- Chapter 3: Risk Assessment
- Chapter 4: Mitigation Strategy
- Chapter 5: Plan Implementation and Maintenance
- Appendices

Table 1.2 shows a comparison between this plan's structure and that of the previous plan, along with a summary of changes in each section from the previous plan.

**Table 1.2. Changes Made in Plan Update**

<b>Changes and Revisions</b>	<b>Current Plan Sections</b>	<b>Previous Plan Sections</b>
Participants, stakeholders, resolution of adoption	Executive Summary & Prerequisites	Introduction
		Prerequisites
Information on the current planning process, including dates, locations, participants, and meetings	Introduction and Planning Process	The Planning Process
Information on the planning area including demographics, economics, and assets as well as the capabilities of each jurisdiction	Planning Area Profile and Capabilities	Risk Assessment
Information on jurisdictions' exposure to hazards	Risk Assessment	
Jurisdictions' previous, continuing, and new actions as well as the goals and objectives for the plan	Mitigation Strategy	Hazard Mitigation Program
Information on implementation with other plans and the maintenance schedule and responsibilities	Plan Implementation and Maintenance	Plan Maintenance Process
Additional relevant data	Appendices	Appendices

## 1.4 Planning Process

The Southeast Missouri Regional Planning Commission (SEMO RPC) was contracted by SEMA to facilitate the update of the HMP. RPC staff assisted local jurisdictions in the establishment of an HMPC as defined by the DMA and updated the committee on current requirements for the HMP process. Planning staff determined the plan had been maintained in accordance with the methodology set forth in the previous plan through communications with all participating jurisdictions on a yearly basis to assess the need for revisions to the plan, of which there were none. SEMO RPC staff also ensured the updated plan met the DMA requirements as established by federal regulations and that it followed the most current planning guidance of FEMA.

The RPC also facilitated the entire plan development process by identifying the data which HMPC participants should provide and conducting research and documentation necessary to augment such data and by soliciting public input in the planning process. Commission staff also produced the draft and final plan update in a FEMA-approvable document and coordinated plan reviews with both SEMA and FEMA.

**Table 1.3. Jurisdictional Representatives Ste. Genevieve County Mitigation Planning Committee**

<b>Name</b>	<b>Title</b>	<b>Department</b>	<b>Jurisdiction/Agency/Organization</b>
Garry Nelson	Presiding Commissioner	Commission	Ste. Genevieve County
Felix Meyer	Emergency Management Dir.	Public Safety	Ste. Genevieve County/Bloomdsdale
David Woods	City Administrator	Administration	St. Mary
David Bova	Community Development Admin	Administration	City of Ste. Genevieve
Paul Taylor	Assistant Superintendent	Administration	Ste. Genevieve R-II School Dist.
Chris Kertz	Director	Administration	Levee District 2
Norman Gallup	Director	Administration	Levee District 3

### **1.4.1 Multi-Jurisdictional Participation**

Active participation in the hazard mitigation planning process is important to ensure each jurisdiction is adequately represented, that their needs and exposures are properly evaluated, and that their actions are appropriate and effective at addressing those needs and exposures. Representatives from the County, incorporated communities, public schools, and stakeholders were invited to participate in the planning process through certified mail and electronic communications. The DMA requires each jurisdiction to participate in the planning process and officially adopt the plan to be considered an eligible participant.

During its first meeting, the HMPC determined the criteria for being considered an eligible participant in this planning process, as follows:

- Representation (direct or through appointee) at a majority of the public HMPC meetings,
- Actively solicit public input and participation in planning process,
- Review prior plan,
- Complete HMP questionnaire,
- Update jurisdiction’s hazard mitigation actions from previous plan,
- Review and comment on new draft, and
- Adoption of new plan.

All jurisdictions met all of the participation requirements.

For small, rural jurisdictions, participation in planning processes such as these can be difficult.

Many rural communities have no full-time staff, and in some cases have only a volunteer clerk. Making committee meetings, completing questionnaires, review previous plans, validating actions, and commenting on drafts are entirely different undertakings for officials who have a full-time day job and a full-time elected position. Additionally, acquiring public input in rural areas can be challenging as well. Many residents lack adequate access to the internet, do not visit their local library or courthouse on a regular basis, and do not subscribe to other media. Limited resources, less population density, and longer commute times mean word of mouth spreads much more slowly in these areas. These issues make it more difficult for small communities and the rural public to participate in planning processes. Given these difficulties, it is commendable that all eligible jurisdictions participated in the plan update process.

Table 1.4 shows the manner of participation for each participating jurisdiction. Meeting sign-in sheets can be found in the appendix.

**Table 1.4. Jurisdictional Participation in Planning Process**

Jurisdiction	Kick-off Meeting	Meeting #2	Data Collection Questionnaire Response	Update/Develop Mitigation Actions
Ste. Genevieve County	X	X	X	X
Bloomsdale	X	X	X	X
St. Mary	X	X	X	X
City of Ste. Genevieve	X	X	X	X
Ste. Genevieve R-II School Dist.	X	X	X	X
Levee Dist. No. 2	X	X	X	X
Levee Dist. No. 3	X	X	X	X

### 1.4.2 The Planning Steps

SEMO RPC and Ste. Genevieve County worked together to establish the framework and process for this planning effort using FEMA’s *Local Mitigation Planning Handbook* (March 2013). The plan update was completed utilizing the 9-task approach within a more broad four-phase process:

1. Organize resources,
2. Assess risks,
3. Develop the mitigation plan, and
4. Implement the plan and monitor progress.

Into this process, SEMO RPC integrated a detailed 10-step planning process adapted from FEMA’s Community Rating System (CRS) and Flood Mitigation Assistance programs. Thus, the process used for this plan meets the funding eligibility requirements of the Hazard Mitigation Grant Program, Pre-Disaster Mitigation Program, Community Rating System, and Flood Mitigation Assistance Program. Table 1.5 shows how this process fits into FEMA’s original four-

phase DMA process as well as the revised Nine Task Process outlined in the 2013 *Local Mitigation Planning Handbook* and the 10-step CRS process.

**Table 1.5. County Mitigation Plan Update Process**

Phase	Community Rating System (CRS) Planning Steps (Activity 510)	Local Mitigation Planning Handbook Tasks (44 CFR Part 201)
I	Step 1. Organize	Task 1: Determine the Planning Area and Resources
		Task 2: Build the Planning Team 44 CFR 201.6(c)(1)
	Step 2. Involve the public	Task 3: Create an Outreach Strategy 44 CFR 201.6(b)(1)
	Step 3. Coordinate	Task 4: Review Community Capabilities 44 CFR 201.6(b)(2) & (3)
II	Step 4. Assess the hazard	Task 5: Conduct a Risk Assessment 44 CFR 201.6(c)(2)(i) 44 CFR 201.6(c)(2)(ii) & (iii)
	Step 5. Assess the problem	
III	Step 6. Set goals	Task 6: Develop a Mitigation Strategy 44 CFR 201.6(c)(3)(i); 44 CFR 201.6(c)(3)(ii); and 44 CFR
	Step 7. Review possible activities	201.6(c)(3)(iii)
	Step 8. Draft an action plan	
IV	Step 9. Adopt the plan	Task 8: Review and Adopt the Plan
	Step 10. Implement, evaluate, revise	Task 7: Keep the Plan Current
		Task 9: Create a Safe and Resilient Community 44 CFR 201.6(c)(4)

**Phase I**

**Step 1: Organize the Planning Team (Handbook Tasks 1 & 2)**

The planning process resulting in the preparation of this plan document officially began with Meeting #1 in Ste. Genevieve, MO on October 17, 2019. Participants of the meeting included representatives from all participating jurisdictions and RPC staff. The purpose of this meeting was to set planning meeting dates, determine hazards to be included in the plan update, discuss options for the flood risk assessment methodology, develop an initial public participation strategy, and discuss the plan update format. Meeting materials are included in the appendix. An HMPC was created that includes representatives from each participating jurisdiction.

After the initial meeting, a second planning meetings was held on October 31, 2019. A complete

list of all representatives of the agencies and organizations that participated on the HMPC is provided in the appendix.

The HMPC communicated during the planning process with a combination of face-to-face meetings, phone interviews, and email correspondence. The meeting schedule and topics are listed in Table 1.6.

**Table 1.6. Schedule of HMPC Meetings**

Meeting	Topic	Date
Planning Meeting #1	General overview of planning process, requirements, and schedule. Introduction to DMA, hazard identification, and public input strategy. Distribution of data collection guide to jurisdictions. Preliminary hazard rankings. Determine process to monitor, evaluate, and update plan.	October 17, 2019
Planning Meeting #2	Review of draft Risk Assessment, distribution of critical facility inventories for jurisdictions to validate/correct, development of plan goals. Mitigation action update, development, and prioritization.	October 31, 2019

During the meetings, SEMO RPC presented information on the scope and purpose of the plan, participation requirements of HMPC members, and the proposed project work plan and schedule. Plans for public involvement (Step 2) and coordination with other agencies and departments (Step 3) were discussed. SEMO RPC also introduced hazard identification requirements and data needs. The HMPC discussed potential hazards as well as past events and impacts and refined the identified hazards relevant to the County. The HMPC made preliminary determinations of probability and magnitude for each hazard identified.

Participants were given the Data Collection Guide to facilitate the collection of information needed to support the plan, such as data on historic hazard events, values at risk, and current capabilities. Each participating jurisdiction completed and returned the worksheets in the Data Collection Guide to the RPC. SEMO RPC integrated this information into the plan, supporting the development of Chapters 2 and 3.

***Step 2: Plan for Public Involvement (Handbook Task 3)***

At the kickoff meeting, the HMPC discussed options for soliciting public input on the mitigation plan. To provide an opportunity for the public to comment during the drafting stage, the committee determined the most effective method would be to invite the public to the HMPC meetings to gather direct input. The public was invited through postings (available in Appendix B) at city halls, libraries, and the county courthouse. Those jurisdictions with a social media presence also made the announcements available there.

The public was also given an opportunity to provide input on a draft of the complete plan prior to its submittal to the State and FEMA. The entire plan draft was made available on the RPC’s website as a PDF document. In addition, two hard copies were made available; one at the Emergency Management Office and the other at the County Courthouse. The County and RPC announced the availability of the entire final draft plan and the two-week final public comment period on their websites. A copy of the announcement is provided in the appendix. The final public comment period was from January 17-January 31, 2020.

The HMPC invited other targeted stakeholders to comment on the draft plan via e-mail, and phone conversations, which are described in greater detail in Step 3: Coordinate with Other Departments and Agencies. Minor comments were received and incorporated.

Much of the public's input was focused on specific actions they wanted jurisdictions to pursue. These suggestions were forwarded to the HMPC and were discussed with the pertinent jurisdiction and with the HMPC. The specific jurisdictions conducted internal assessments of the suggestions and incorporated the actions when feasible.

### ***Step 3: Coordinate with Other Departments and Agencies and Incorporate Existing Information (Handbook Task 3)***

There are numerous organizations whose goals and interests interface with hazard mitigation in Ste. Genevieve County. Coordination with these organizations and other community planning efforts is vital to the success of this plan. The County invited neighboring counties, other local, state, and federal departments and agencies to the planning meetings to learn about the hazard mitigation planning initiative. In addition, the HMPC developed a list of additional stakeholders involved in hazard mitigation activities, to invite to review and comment on the draft of the Multi-jurisdictional Hazard Mitigation Plan prior to submittal to the State and FEMA. Those agencies invited to meetings and/or comment on the plan draft included emergency management officials of adjacent counties, economic development agencies, and various state agencies such as the Department of Natural Resources and MoDOT. All positions were notified via written notice or email.

### **Coordination with FEMA Risk MAP Project**

St. Francois County is designated as “Effective FIS/FIRM” for the Risk MAP project. Risk Mapping, Assessment, and Planning (Risk MAP) is the Federal Emergency Management Agency (FEMA) Program that provides communities with flood information and tools they can use to enhance their mitigation plans and take action to better protect their citizens.

Through collaboration with State, Tribal, and local entities, Risk MAP delivers quality data that increases public awareness and leads to action that reduces risk to life and property. This data is not yet available for the County, though work is underway as the county falls into the Data Development Category. Figure 1.1 Risk MAP Status Map shows the status of regional counties.

## Integration of Other Data, Reports, Studies, and Plans

In addition, input was solicited from many other agencies and organizations that provided information but were not able to attend planning meetings. As part of the coordination with other agencies, the HMPC collected and reviewed existing technical data, reports, and plans. These included:

- Missouri Hazard Mitigation Plan,
- Ste. Genevieve County Hazard Mitigation Plan (2014),
- National Flood Insurance Program's Community Information System Reports,
- Digital Flood Insurance Rate Maps,
- DNR Dam and Reservoir Safety Program,
- DNR Sinkhole Location Data,
- MO Land Use Land Cover Data,
- National Fire Incident Reporting System Fire Incident Data,

- 
- Various local plans such as Comprehensive Plans, Economic Development Plans, Emergency Operations Plans, Capital Improvement Plans, etc.

This information was used in the development of the hazard identification, vulnerability assessment, and capability assessment and in the formation of goals, objectives, and mitigation actions. These sources, as well as additional sources of information are documented throughout the plan and in the appendix.

## ***Phase 2: Assess Risk (Handbook Task 5)***

### ***Step 4: Assess the Hazard: Identify and Profile Hazards***

SEMO RPC assisted the HMPC in a process to identify the hazards that have impacted or could impact communities in the County. At the first meeting, the HMPC examined the history of disaster declarations in the County, the list of hazards considered in the 2013 Missouri State Hazard Mitigation Plan, and the hazards identified in the previous hazard mitigation plan. The committee then worked through this list of all potential hazards that could affect the planning area. They discussed past hazard events, types of damage, and where additional information might be found. The committee identified 11 natural hazards that have the potential to impact the planning area. Additional information on the hazard identification process and which hazards were identified for each jurisdiction is provided in Chapter 3.

During the kick-off meeting, the HMPC refined the list of hazards to make the analysis relevant to the County, discussed past events and impacts and came to consensus on the preliminary probability and magnitude on a county-wide basis. In addition, each jurisdiction completed a Data Collection Guide, including information on previous hazard events in their community. Utilizing the information from the Data Collection Guides as well as existing plans, studies, reports, and technical information as well as information available through internet research and GIS analysis, a profile was developed for each hazard identified. More information on the methodology and resources used to identify and profile the hazards can be found in Chapter 3.

### ***Step 5: Assess the Problem: Identify Assets and Estimate Losses***

Assets for each jurisdiction were identified through a combination of several resources. A listing of critical facilities in each jurisdiction from the previous HMP was presented at Meeting #2 for correction and validation. Methodologies and results of the analyses are provided in Chapter 3.

Additional assets such as historic, cultural, and economic assets as well as specific vulnerable populations and structures were obtained from a variety of sources as described in Chapter 3.

The HMPC also analyzed development trends from data available from the U.S. Census Bureau as well as information obtained from each jurisdiction such as Comprehensive Plans and Future Development Plans. For each hazard, there is a discussion regarding future development and how it may impact vulnerability to that specific hazard.

After profiling the hazards that could affect the County and identifying assets, the HMPC collected information to describe the likely impacts of future hazard events on the participating jurisdictions.

Existing mitigation capabilities were also considered in developing loss estimates. This

---

assessment consisted of identifying the existing mitigation capabilities of participating jurisdictions. This involved collecting information about existing government programs, policies, regulations, ordinances, and plans that mitigate or could be used to mitigate risk from hazards. Participating jurisdictions collected information on their regulatory, personnel, fiscal, and technical capabilities, as well as previous and ongoing mitigation initiatives. This information is included in Chapter 2 Planning Area Profile and Capabilities.

Specific capabilities such as participation in the National Flood Insurance Program as well as designation and placement of storm sirens are incorporated in the vulnerability analysis discussions, where applicable.

Taking into consideration the vulnerability and capability assessments, and where sufficient information was available, a variety of methods were used to estimate losses for each profiled hazard. For geographic hazards such as river flooding and wild fire, specific assets at risk and loss estimates were determined through GIS analysis. For other hazards such as weather-related hazards, loss estimates were developed based on statistical analysis of historic events and HMPC input. For dam and levee failure, GIS data was not available to identify specific geographic boundaries at risk. Therefore, the risk assessment is based on aerial photography analysis of development within an estimated hazard area. The methodologies for each loss estimate are described in detail in Chapter 3. Within each hazard section, the text provides details on how the hazard varies by jurisdiction, where applicable. In addition, at the conclusion of each hazard section, a summary table indicates the specific probability and magnitude of the hazard for each jurisdiction to show how the hazard varies. Where applicable, introductory text preceding the table highlights noted variables.

Results of the preliminary risk assessment were presented at Meeting #2 and the Draft Risk Assessment (Chapter 3) was provided to the HMPC for review and comment. Several comments, corrections, and suggestions were provided to SEMO RPC and incorporated into the risk assessment as appropriate.

### ***Phase 3: Develop the Mitigation Plan (Handbook Task 6)***

#### ***Step 6: Set Goals***

SEMO RPC facilitated a discussion session with the HMPC during Meeting #2 to review and update goals. Common categories of mitigation goals were presented as well as the 2013 State Hazard Mitigation Plan goals.

This planning effort is an update to an existing hazard mitigation plan. As a result, the goals from the previous plan were reviewed. The planning committee decided the 2014 goals are still valid. The goals for the plan update are provided below.

1. Protect the health, safety, and welfare of residents and students.
2. Ensure the operation of critical facilities and services.
3. Protect public and private property.
4. Enhance informed decision making of mitigation actions.

#### ***Step 7: Review Possible Mitigation Actions and Activities***

One of the focuses of Meeting #2 was to update the mitigation strategy by reviewing existing actions submitted in the previous mitigation plans as well as discuss relevant new actions

---

considered necessary as a result of the updated risk assessment. The development of mitigation actions was facilitated through group discussion of the capabilities and risks of each jurisdiction. Consideration was given to the analysis results provided in the risk assessment and the anticipated success for each project type. Committee members discussed issues such as: availability of funds, prioritization of actions, and feasibility of implementation utilizing the STAPLEE methodology as a guide. Projects relating to emergency response were discussed, but participants were encouraged to focus on long-term mitigation solutions since response-related mitigation actions occur on a routine basis as requirements of other plans. Complex projects that would necessitate use of large numbers of county resources were also discussed. This opportunity to discuss a broad range of mitigation alternatives allowed the jurisdictions to understand the overall priorities of the committee and to allow for discussion of the types of project most beneficial to each jurisdiction. As part of this discussion, consideration was given to the potential cost of each project in relation to the anticipated future cost savings.

Since this plan is an update to the *2014 Hazard Mitigation Plan*, the update of the mitigation strategy included review and update of the status of all actions included in the previous hazard mitigation plan. Jurisdictions were encouraged to maintain a focused approach and continue forward only those actions that are aimed at implementing long-term solutions to prevent losses from hazards. To facilitate the update of previous actions, a spreadsheet was provided to each jurisdiction prior to Meeting #2 with the actions they submitted in the previous mitigation plan. The jurisdictions were also provided instructions for completing the status of each of the previous actions as well as the details to provide for continuing and newly developed actions. A modified form of the STAPLEE prioritization tool was provided to assist jurisdictions in determining the prioritization that should be assigned to each action. Each participating jurisdiction prioritized the projects they submitted by indicating high, moderate, or low local priority. The completed spreadsheets with action details were returned to SEMO RPC. Chapter 4 provides additional details regarding the process undertaken to refine the mitigation strategy to make the County and its jurisdictions more disaster resistant.

### ***Step 8: Draft an Action Plan***

A complete draft of the plan was made available online and in hard copy for review and comment by the public, other agencies and interested stakeholders. This review period was from January 17-January 31, 2020. Methods for inviting interested parties and the public to review and comment on the plan were discussed in Steps 2 and 3, and materials are provided in the appendix. Comments were integrated into a final draft for submittal to SEMA and FEMA.

### ***Step 9: Adopt the Plan (Handbook Task 8)***

To secure buy-in and officially implement the plan, the governing bodies of each participating jurisdiction adopted the plan. Scanned copies of resolutions of adoption are included in the appendix of this plan.

### ***Step 10: Implement, Evaluate, and Revise the Plan (Handbook Tasks 7 & 9)***

The HMPC developed and agreed upon an overall strategy for plan implementation and for monitoring and maintaining the plan over time during Meeting #1. This strategy is described in Chapter 5, Plan Maintenance Process.

<b>2.2 Jurisdictional Profiles and Mitigation Capabilities.....</b>	<b>12</b>
2.2.1 Unincorporated Ste. Genevieve County.....	12
2.2.2 City of Bloomsdale .....	16
2.2.3 City of St. Mary.....	19
2.2.4 City of Ste. Genevieve .....	22
2.2.5 Summary of County/Municipality Capabilities.....	25
2.2.6 Public School District Profiles and Mitigation Capabilities .....	28
2.2.7 Special District Profiles and Mitigation Capabilities .....	31

This chapter provides a general profile of Ste. Genevieve County followed by individual sections for each participating jurisdiction. The section for each jurisdiction provide an overview profile as well as details on existing capabilities, plans, and programs that enhance their ability to implement mitigation strategies.

### 2.1 Ste. Genevieve County Planning Area Profile

Figure 2.1 provides a map of the Ste. Genevieve County planning area. As of 2017, the total Ste. Genevieve County population was 17,882, a decline of -1% since 2012. The population growth rate of -1% was below both the nation's (4%) and the State's (2%). Ste. Genevieve County median household income was \$50,959 in 2017, an increase of 7% over 2012, which is lower than the national and state rates of 9%. The county's 2017 MHI is also below that of both the nation and state, \$57,652 and \$51,542 respectively. Ste. Genevieve County median home value in 2017 was \$157,600, up 14% from 2012 census estimates. County median home value is slightly above the state's median value and below the nation's median value (\$155,100 and \$214,500), while the rate of growth outpaced both the state's rate of 4% and the nation's of 8%.

**Figure 2.1. Map of Ste. Genevieve County**

### **2.1.2 Geography, Geology and Topography**

Ste. Genevieve County is located in the southeastern part of Missouri. It is bounded on the east by the Mississippi River, the south by Perry County, the west by St. Francois County, and on the north by Jefferson County. The County's terrain ranges from lowland floodplains along the Mississippi River to upland forests. The diversity of the County's terrain makes it an attractive place to live.

The County can be divided into four physiographic divisions for purposes of this report. The Ste. Genevieve

---

("Becket") Hills includes the majority of the County. It is a topographic unit occupying a 7- to 16-mile wide belt extending from western Perry County, northwestward through Ste. Genevieve County and northeastern St. Francois County. The Perryville Sinkhole Plain lies along the eastern part of the County. It extends southward in a belt from 3 to 15 miles wide from the vicinity of Ste. Genevieve to Cape Girardeau. The Farmington Plain occupies a broad, basin-like area in the eastern half of St. Francois County and western Ste. Genevieve County. The final physiographic division is the Mississippi Bottoms which consist of the Mississippi River floodplain in Ste. Genevieve County. The Bottoms range in width from 1½ to 5 miles wide. The "Big Field" and Clement Bottoms are part of this division in Ste. Genevieve County (Exhibit No. 2).

Soils in the County are divided into roughly five associations. The Westerville-Fatima-Wabash Association occurs in the southeastern part of the County on broad, nearly level floodplains and terraces of the larger streams and rivers. The soils in the association have formed in silty and clayey alluvium. Westerville soils are deep, somewhat poorly drained and are found on low terraces with slopes ranging up to 3%. Fatima soils are deep, moderately well drained, and are found on floodplains. They have a silt-loam topsoil overlying a moderately-permeable, silt-loam subsoil. These soils are found on nearly level areas with slopes ranging up to 2%. Wabash soils are also found in floodplains, but they are deep and poorly drained. This is reflected in the fact that they are referred to locally as "gumbo."

The Menfro-Winfield Association occurs in the eastern uplands of Ste. Genevieve County. These soils are developed in loess, and as a result, they are subject to severe erosion and gulying if not managed properly. The typical landscape in which they are found includes cultivated fields on gently to strongly sloping uplands and pastures on steeper side slopes. Menfro soils are deep, well drained, and occur on ridgetops and side slopes where slopes range from 2% to 30%. These soils have a silt-loam topsoil overlying a moderately permeable, silty-clay-loam subsoil. Winfield soils are also found on ridgetops on slopes that range from 2% to 20%. These soils have a silt-loam topsoil overlying a moderately permeable, silty-clay-loam subsoil.

A third association present in the County is the Union-Gross-Gasconade-Crider group. This is found in central Ste. Genevieve County. The terrain in which these soils occur includes small areas of pasture and cultivated land on gently to moderately sloping ridgetops and forested, long, moderate to very steep side slopes. The soils have formed in cherty limestone residual material, although Union and Crider soils also have a thin layer of loess present. Union soils have a fragipan (hardpan) layer, although they are moderately well drained. They have a silt-loam topsoil grading downward into a moderately permeable subsoil overlying a massive fragipan. Goss soils are deep, well drained, and occur on steep upland slopes of 2% to 45%. They have a cherty, silt-loam topsoil overlying a moderately permeable, very cherty, silty-clay subsoil. Gasconade soils are shallow, somewhat excessively drained and occur on steep upland slopes. They have a flaggy clay-loam topsoil overlying a flaggy, clay subsoil that has moderately slow permeability. Crider soils are deep, well drained upland soils that also occur in some areas with karst (sinkhole) topography. They have a silt-loam topsoil overlying a moderately permeable, silty-clay-loam subsoil.

The Jonca-Lamotte-Lily-Ramsey Association is found in a relatively small area of Ste. Genevieve County. The soils are formed from residual material weathered from sandstone bedrock. They are found on broad, gently to moderately sloping pastures. Jonca soils occur on convex upland ridges with slopes ranging between 2% and 9%. They have a silt-loam topsoil and a slowly permeable, silty-clay-loam subsoil. The subsoil overlies a compact, massive, brittle, loam fragipan. Lamotte soils are well drained and occur on uplands with slopes of 5% to 14%. They have a silt-loam topsoil overlying a silty-clay-loam subsoil with moderate to moderately slow permeability. Lily soils are moderately deep, well drained, and are found on upland slopes and ridges. They have a loam topsoil overlying a clay-loam subsoil that has moderately rapid permeability. Ramsey soils are shallow, somewhat excessively drained soils found on hills with slopes of 10% to 70%. They have a loam topsoil overlying a rapidly permeable loam subsoil.

---

The final association is the Crider-Cantwell-Gasconade. This occupies a small area in Ste. Genevieve County. These areas typically consist of forested, long, moderately sloping to very steep side slopes and small pastures, and cultivated land on gently to moderately sloping ridgetops. The soils developed in residual material weathered from limestone, with a thin mantle of loess. Crider soils are deep, well drained, and occur on uplands with slopes ranging to 20%, including some relatively small areas with karst topography. The soils have a low available water capacity and consist of silt-loam topsoil overlying a silty-clay-loam subsoil. Cantwell soils are moderately well drained upland soils. They have a low available water capacity and have a topsoil of silt-loam that overlies a silty-clay-loam subsoil. Gasconade soils occur on steep upland slopes ranging from 2% to 35%. They are shallow, somewhat excessively drained, and have a very low available water capacity. They have a flaggy (limestone), clay-loam topsoil overlying a flaggy, clay subsoil with moderately slow permeability.

Bedrock in Ste. Genevieve County consists of several types (Exhibit No. 3). A small area of alluvium underlies the area of the “Big Field” near Ste. Genevieve City. A band of limestone and dolomite, mixed with some shale, underlies the eastern third of the County. Abutting its western edge through most of the County is a narrow band of sandstone. Dolomite mixed with limestone, sandstone and shale underlies a strip through the central third of the County. A narrow band of dolomite and sandstone lies in the center of this formation, extending southward from the Jefferson County line to approximately halfway through the County. A large area of sandstone lies in the west central part of the County and extends into St. Francois County.

### **2.1.3 Climate**

Because the County is located in the middle section of the United States, it is prone to several kinds of natural hazards. The county has a continental climate, meaning that the weather is changeable and has large variations in temperature and precipitation.

The county’s climate parallels that of southeast Missouri. In general, the county has hot humid summers and mild to cold winters. Average temperatures fall in the 56° to 58° range. The warmest month is normally July, when average maximum temperatures are around 90° to 92°, and minimum temperatures range in the neighborhood of 62° to 68°. The coldest month is usually January, when maximum temperatures reach an average of only 45° to 46°, and minimum average temperatures run 25° to 28°. Below freezing temperatures usually occur on 80 to 100 days during the year.

Rainfall averages approximately 39 to 42 inches per year, while snowfall averages approximately 11 to 13 inches per year. Springtime and early summer are normally the seasons when much of the rainfall occurs during frequent thunderstorms. This is also the time when flooding normally occurs along the creeks and rivers in the county. On average, 60% of the annual rainfall occurs during the months from April through September.

### **2.1.4 Population/Demographics**

Table 2.1 provides the populations for each city and the unincorporated county for 2012 and 2017 with the number and percent change. The unincorporated area’s population was determined by subtracting the populations of the incorporated areas from the overall county population.

---

**Table 2.1. Ste. Genevieve County Population 2012-2017 by Community**

---

Population				
	2012	2017	Change	% Change
Ste. Genevieve County	18,066	17,882	-184	-1%
Bloomsdale	524	744	220	42%
St. Mary	376	426	50	13%
Ste. Genevieve	4,392	4,443	51	1%
Unincorporated County	12,774	12,269	-505	-4%
Missouri	5,982,413	6,075,300	92,887	2%
United States	309,138,711	321,004,407	11,865,696	4%

Source: American FactFinder

According to the 2017 ACS, 5% of the county population is under the age of 5 and 18% is 65 and older. In 2017 there were 8,727 households with an average household size of 2.05 people.

The University of South Carolina developed an index to evaluate and rank the ability to respond to, cope with, recover from, and adapt to disasters. The index synthesizes 30 socioeconomic variables which research literature suggests contribute to reduction in a community's ability to prepare for, respond to, and recover from hazards. SoVI<sup>®</sup> data sources include primarily those from the United States Census Bureau.

Figure 2.2 shows the county has a Medium-Low Social Vulnerability Index when compared to counties nationwide and a Medium-Low SoVI when compared to counties state-wide.

**Figure 2.2. Ste. Genevieve County Social Vulnerability Index (SoVI)**

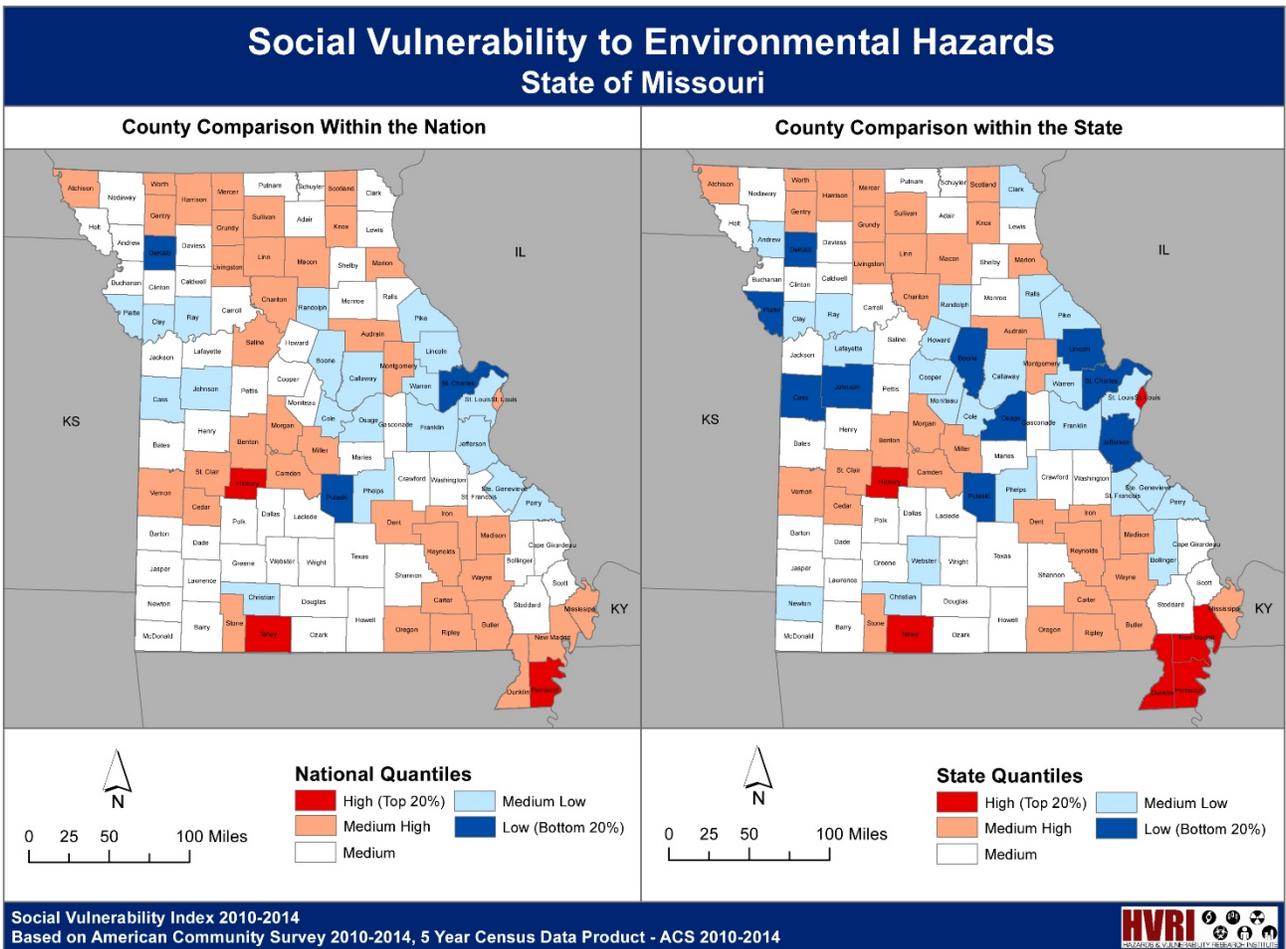

Table 2.2 provides additional demographic and economic indicators for participating jurisdictions. The county values are for all of the county, including the incorporated cities.

**Table 2.2. 2017 Selected Demographics**

Jurisdiction	% Labor Force Participation	% Population Unemployed	% Population Below Poverty Level	% Population High School graduate	% of Population with Bachelor's Degree or higher	% Households Limited English Proficiency
Ste. Genevieve County	61.8%	4.6%	16.6%	87.3%	15.6%	0.0%
Bloomsdale	63.0%	3.4%	8.9%	87.3%	18.9%	1.0%
St. Mary	61.2%	19.2%	18.5%	83.7%	11.1%	0.0%
Ste. Genevieve	58.2%	5.7%	30.9%	90.7%	12.8%	0.0%

## 2.1.5 History

Ste. Genevieve County is a county located in the Lead Belt region of Missouri. Its county seat and largest city is Ste. Genevieve. The county was officially organized on October 1, 1812 and was named after the Saint Genevieve, the patroness of Paris, France. The county includes the earliest settlement west of the Mississippi River. Agriculture and manufacturing have historically been the largest economic engines of the county.

## 2.1.6 Occupations

Table 2.3 provides occupation statistics for the participating cities and the county as a whole.

**Table 2.3. Occupation Statistics, Ste. Genevieve County, Missouri**

Jurisdiction	Management, business, science, and arts	Service	Sales and office	Natural resources, construction, and maintenance	Production, transportation, and material moving
Ste. Genevieve County	25%	19%	18%	18%	21%
Bloomsdale	33%	22%	23%	11%	11%
St. Mary	32%	27%	2%	5%	33%
Ste. Genevieve	20%	29%	10%	8%	33%

Source: U.S. Census, 2017 American Community Survey, 5-year Estimates.

## 2.1.7 Agriculture

According to the USDA’s 2017 Census of Agriculture, Ste. Genevieve County had 660 farms comprised of 168,529 acres, with an average size of 255 acres. Four hundred of the farms in the county fall into the range of 50-499 acres. The average market value of land and buildings per farm was \$753,601. Crops account for approximately \$18.2 million of agriculture sales in the county, while livestock and poultry account for \$13.6 million in sales.

### 2.1.8 FEMA Hazard Mitigation Assistance (HMA) Grants In Planning Area

Since 1993, there have been three HMA grants in Ste. Genevieve County totaling \$1,139,529 in total project costs.

**Table 2.4. FEMA HMA Grants In County, 1993-2019**

Disaster Declaration	Project Type	Sub-Grantee	Date Approved	Project Total
995	Acquisition of Private Real Property	St. Mary	1994-04-12	\$331,176
995	Acquisition of Private Real Property	City of Ste. Genevieve	1995-02-02	\$706,915

## 2.2 Jurisdictional Profiles and Mitigation Capabilities

This section includes individual profiles for each participating jurisdiction as well as a discussion of previous mitigation initiatives and a summary table indicating specific capabilities of each jurisdiction that relate to their ability to implement mitigation opportunities. The unincorporated county is profiled first, followed by the incorporated cities and then special districts.

### 2.2.1 Unincorporated Ste. Genevieve County

The jurisdiction of Ste. Genevieve County includes all unincorporated areas within the county boundaries. The county government is a County Commission comprised of a Presiding Commissioner voted on by the entire county, and two Associate Commissioners voted on by their respective districts. The County government includes the following departments and offices:

- County Commissioners
- County Assessor
- County Attorney
- County Auditor
- County Recorder
- County Sheriff
- County Treasurer
- Emergency Management
- Health Department

#### Mitigation Initiatives/Capabilities

## **2.2.6 Public School District Profiles and Mitigation Capabilities**

This section includes general profile information for Ste. Genevieve R-II School District. The school district fully participated in the development process of this plan. Multiple other school districts cover small portions of the county; however, none of these districts have any structures or assets located in Ste. Genevieve County and are not included in this mitigation plan. For information on those school districts, see their respective county HMPs.

Figure 2.3. Ste. Genevieve County School Districts

**Table 2.11. School District Buildings and Enrollment Data, 2017**

District Name	Building Name	Building Enrolment
Ste. Genevieve R-II	Bloomdale Elem.	315
Ste. Genevieve R-II	Ste. Genevieve Elem.	550
Ste. Genevieve R-II	Ste. Genevieve Middle	393
Ste. Genevieve R-II	Ste. Genevieve High	592

[apps.dese.mo.gov/MCDS/Home.aspx](https://apps.dese.mo.gov/MCDS/Home.aspx)

**Table 2.12. Summary of Mitigation Capabilities-Ste. Genevieve R-II School District**

Planning Elements	Yes/No	Date of Latest Version	Comments
Master Plan	Yes	2019	
Capital Improvement Plan	Yes	2015	
<b>School Emergency Plan</b> Shelter in place protocols Evacuation protocols	Yes	2019	
Weapons Policy	Yes	2016	

**Administrative/Technical**

Identify the technical and personnel resources responsible for activities related to hazard mitigation/loss prevention within your school district / institution.

Personnel Resources	Yes/No	Department/Position	Comments
Full-time building official (i.e. Principal)	Yes	Assistant Superintendent	
Emergency Manager	Yes	Superintendent	
Grant Writer	Yes	Assistant Superintendent	
Public Information Officer	Yes	Communications Director	

**Financial Resources**

Identify whether your school district /institution has access to or is eligible to use the following financial resources for hazard mitigation.

Financial Resources	Accessible/Eligible to Use (Y/N)	Comments
Capital improvements project funding	Yes	
Local funds	Yes	
General obligation bonds	Yes	
Special tax bonds	Yes	
Private activities/donations	Yes	
State and federal funds	Yes	

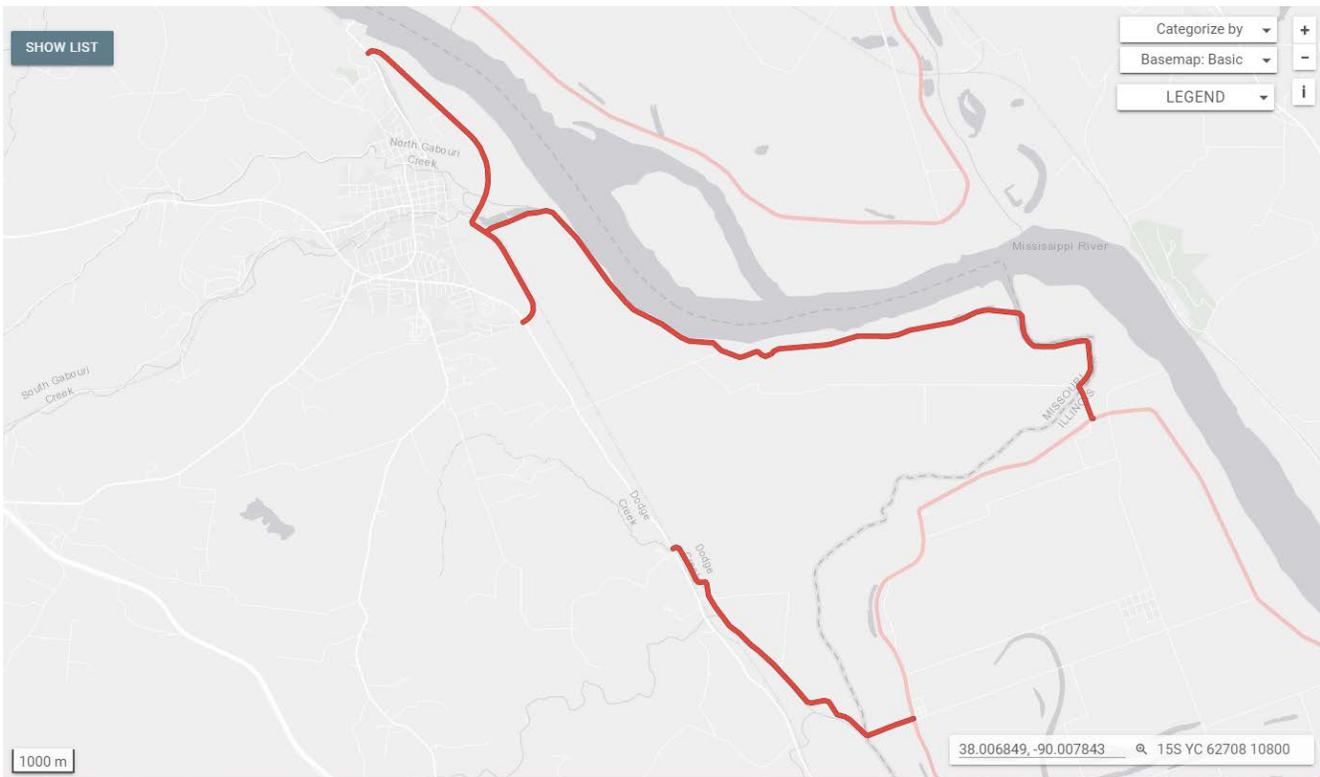

## 2.2.7 Special District Profiles and Mitigation Capabilities

This section includes general profile information for Levee Districts 2 and 3. Both districts fully participated in the development process of this plan. Figure 2.4 shows the locations of the levee systems in the county.

The National Levee Database, maintained by the Army Corp of Engineers, provides the following information about Levee District No. 2: “The Sainte Genevieve No.2 Levee System reduces the risk of flooding from the Mississippi River to the Sainte Genevieve County, MO. The system was privately constructed and locally operated and maintained by the nonfederal Sponsor, Sainte Genevieve County Levee District No. 2. Levee system construction began in 1978, and the levee consists of over 11 miles of earthen embankment along the Mississippi River. The nearly 7,700-acre leveed area is primarily agricultural bottomland. The system reduces flood risk to a few residences, productive agricultural land, and four miles of rail line.”

The NLD includes the following information about Levee District No. 3: “The Sainte Genevieve No.3 Levee System reduces the risk of flooding from the Mississippi River to the community of Sainte Genevieve, MO. The system is federally authorized and constructed and locally operated and maintained by the nonfederal Sponsor, Sainte Genevieve County Levee District No. 3. The levee system was completed in 2001 and consists of 3.5 miles of earthen embankment along the Mississippi River. Within the nearly 970-acre leveed area are important archaeological sites, agricultural bottomland, and Ste. Genevieve’s Historic District, which includes the Louis Bolduc House a National Historic Landmark built in 1792. This system provides benefits to approximately 740 residents and approximately \$37 million in property. During the 2016 flood event, it is estimated that the system prevented \$14 million in flood damages.”

---

The goal of the risk assessment is to estimate the potential loss in the planning area, including loss of life, personal injury, property damage, and economic loss, from a hazard event. The risk assessment process allows communities and school/special districts in the planning area to better understand their potential risk to the identified hazards. It will provide a framework for developing and prioritizing mitigation actions to reduce risk from future hazard events.

There have been little changes in the County over the past 5 years. Between 2012 and 2017 (most recent data), the county population decreased by 1% and the city of Ste. Genevieve saw a population growth of 1%. However, the cities of Bloomsdale and St. Mary saw significant growth in population, with Bloomsdale experiencing a growth of 220 residents (42%) and St. Mary of 50 residents (13%). While Bloomsdale and St. Mary saw significant growth in population, there has been only marginal commercial, office, and industrial development in the county and the communities. Combined, these changes mean that much of the exposure and risk in the planning area has remained relatively unchanged since the 2014 plan except in Bloomsdale and St. Mary, as noted throughout this chapter when applicable.

This chapter is divided into four main parts:

- **Section 3.1 Hazard Identification** identifies the hazards that threaten the planning area and provides a factual basis for elimination of hazards from further consideration;
- **Section 3.2 Assets at Risk** provides the planning area's total exposure to natural hazards, considering critical facilities and other community assets at risk;
- **Section 3.3 Future Land Use and Development** discusses areas of planned future development
- **Section 3.4 Hazard Profiles and Vulnerability Analysis** provides more detailed information about the hazards impacting the planning area. For each hazard, there are three sections: 1) Hazard Profile provides a general description and discusses the threat to the planning area, the geographic location at risk, potential severity/magnitude/extent, previous occurrences of hazard events, probability of future occurrence, risk summary by jurisdiction, impact of future development on the risk; 2) Vulnerability Assessment further defines and quantifies populations, buildings, critical facilities, and other community/school or special district assets at risk to natural hazards; and 3) Problem Statement briefly summarizes the problem and develops possible solutions.

---

## 3.1 Hazard Identification

---

The 11 hazards identified for this plan update are listed below:

- Dam Failure
- Drought
- Earthquake
- Extreme Heat
- Wildfires
- Flash & Riverine Flooding
- Sinkholes
- Levee Failure
- Severe Thunderstorms
- Tornadoes
- Severe Winter Weather

It should be noted that this mitigation plan, like most local HMP in the state, only includes natural hazards and does not address “man-made” hazards such as terrorism, structural fires, chemical spills, etc.

Sections 3.1.1 through 3.1.3 describe how these hazards were identified for this plan update.

### 3.1.1 Review of Existing Mitigation Plans

---

To determine which hazards to include in this plan update cycle, the HMPC considered all hazards from the previous HMP, hazards from surrounding counties’ HMPs, and the State’s current HMP. The HMPC decided to carry forward the hazards from the 2014 plan into this plan unchanged, as they felt there had been no significant changes in the county to warrant revision.

### 3.1.2 Review Disaster Declaration History

---

Federal disaster declarations may be granted when the severity and magnitude of an event surpasses the ability of the local government to respond and recover. Disaster assistance is supplemental and sequential. When the local government’s capacity has been surpassed, a state disaster declaration may be issued, allowing for the provision of state assistance. If the disaster is so severe that both the local and state governments’ capacities are exceeded; a federal emergency or disaster declaration may be issued allowing for the provision of federal assistance.

FEMA also issues emergency declarations, which are more limited in scope and do not include the long-term federal recovery programs of major disaster declarations. Determinations for declaration type are based on scale and type of damages and institutions or industrial sectors affected.

---

**Table 3.1. FEMA Disaster Declarations, Ste. Genevieve County, Missouri, 2007-2019**

<b>Disaster Number</b>	<b>Description</b>	<b>Incident Period</b>	<b>Individual Assistance (IA) Public Assistance (PA)</b>
DR-4451	Severe Storms, Tornadoes, and Flooding	4/29/2019 – 7/5/2019	PA
DR-4435	Severe Storms, Straight-line Winds, and Flooding	3/11/2019 – 4/16/2019	PA
DR-4317	Severe Storms, Tornadoes, Straight-line Winds, and Flooding	4/28/2017 – 5/11/2017	IA, PA
DR-4250	Severe Storms, Tornadoes, Straight-line Winds, and Flooding	12/23/2015 – 1/9/2016	IA, PA
DR-4238	Severe Storms, Tornadoes, Straight-line Winds, and Flooding	5/15/2015 – 7/27/2015	PA
DR-4130	Severe Storms, Straight-line Winds, Tornadoes, and Flooding	5/29/2013 – 6/10/2013	PA
DR-1980	Severe Storms, Tornadoes, and Flooding	4/10/2011 - 6/6/2011	PA
DR-1847	Severe Storms, Tornadoes, and Flooding	5/8/2009 - 5/16/2009	PA
DR-1809	Severe Storms, Flooding, and a Tornado	9/11/2008 – 9/24/2008	PA
DR-1773	Severe Storms and Flooding	6/1/2008 – 8/13/2008	PA
DR-1749	Severe Storms and Flooding	3/17/2008 - 5/9/2008	PA
EM-3374	Severe Storms, Tornadoes, Straight-line Winds, and Flooding	12/22/2015 – 1/09/2016	
EM-3325	Flooding	6/1/2011 – 8/1/2011	
EM-3317	Severe Winter Storm	1/31/2011 – 2/05/2011	
EM-3303	Severe Winter Storm	1/26/2009 – 1/28/2009	
EM-3281	Severe Winter Storms	12/08/2007 – 12/15/2007

---

### **3.1.3 Research Additional Sources**

Additional data on locations and past impacts of hazards in the planning area was collected from the following sources:

- Missouri Hazard Mitigation Plans (2018)
- 2014 Ste. Genevieve County Hazard Mitigation Plan
- Federal Emergency Management Agency (FEMA)
- Missouri Department of Natural Resources (MDNR)
- National Drought Mitigation Center Drought Reporter
- US Department of Agriculture’s (USDA) Risk Management Agency Crop Insurance Statistics
- National Agricultural Statistics Service (Agriculture production/losses)
- Data Collection Questionnaires completed by each jurisdiction
- State of Missouri GIS data

- 
- Environmental Protection Agency (EPA)
  - Flood Insurance Administration
  - Missouri Department of Transportation (MoDOT)
  - Missouri Division of Fire Marshal Safety
  - National Fire Incident Reporting System (NFIRS)
  - National Oceanic and Atmospheric Administration's (NOAA) National Centers for Environmental Information (NCEI);
  - County and local Comprehensive Plans when available
  - County Emergency Management
  - County Flood Insurance Rate Map, FEMA
  - SILVIS Lab, Department of Forest Ecology and Management, University of Wisconsin
  - U.S. Army Corps of Engineers
  - U.S. Department of Transportation
  - United States Geological Survey (USGS)

Note that the only centralized source of data for many of the weather-related hazards is the National Oceanic and Atmospheric Administration's (NOAA) National Centers for Environmental Information (NCEI). Although it is usually the best and most current source, there are limitations to the data which should be noted. The NCEI documents the occurrence of storms and other significant weather phenomena having sufficient intensity to cause loss of life, injuries, significant property damage, and/or disruption to commerce. In addition, it is a partial record of other significant meteorological events, such as record maximum or minimum temperatures or precipitation that occurs in connection with another event. Some information appearing in the NCEI may be provided by or gathered from sources outside the National Weather Service (NWS), such as the media, law enforcement and/or other government agencies, private companies, individuals, etc. An effort is made to use the best available information but because of time and resource constraints, information from these sources may be unverified by the NWS. Those using information from NCEI should be cautious as the NWS does not guarantee the accuracy or validity of the information.

The NCEI damage amounts are estimates received from a variety of sources, including those listed above in the Data Sources section. For damage amounts, the NWS makes a best guess using all available data at the time of the publication. Property and crop damage figures should be considered as a broad estimate. Damages reported are in dollar values as they existed at the time of the storm event. They do not represent current dollar values.

The database currently contains data from January 1950 to March 2014, as entered by the NWS. Due to changes in the data collection and processing procedures over time, there are unique periods of record available depending on the event type. The following timelines show the different time spans for each period of unique data collection and processing procedures.

1. Tornado: From 1950 through 1954, only tornado events were recorded.
2. Tornado, Thunderstorm Wind and Hail: From 1955 through 1992, only tornado, thunderstorm wind and hail events were keyed from the paper publications into digital data. From 1993 to 1995, only tornado, thunderstorm wind and hail events have been extracted from the Unformatted Text Files.
3. All Event Types (48 from Directive 10-1605): From 1996 to present, 48 event types are recorded as defined in NWS Directive 10-1605.

Note that injuries and deaths caused by a storm event are reported on an area-wide basis. When reviewing a

---

table resulting from an NCEI search by county, the death or injury listed in connection with that county search did not necessarily occur in that county.

### **3.1.4 Hazards Identified**

---

Through the hazard identification review process, 11 natural hazards that have the potential to significantly affect the planning area were chosen for further analysis in the risk assessment. The hazards identified for this plan update are shown in Table 3.2. Although 11 hazards were identified, not all hazards impact every jurisdiction. In addition to listing the hazards selected for this plan, Table 3.2 also provides a summary of the jurisdictions impacted by each hazard. An “X” indicates the jurisdiction is impacted by the hazard, while a “-” indicates the hazard is not applicable to that jurisdiction.

**Table 3.2. Hazards Identified for Each Jurisdiction**

Hazard	Ste. Genevieve County	Bloomdsdale	St. Mary	Ste. Genevieve	Ste. Genevieve R-II	Levee Dist. No. 2	Levee Dist. No. 3
Dam Failure	X	-	-	X	-	-	-
Drought	X	X	X	X	-	-	-
Earthquake	X	X	X	X	X	X	X
Extreme Heat	X	X	X	X	-	-	-
Flash & Riverine Flooding	X	-	X	X	-	X	X
Levee Failure	X	-	-	X	-	X	X
Severe Thunderstorm	X	X	X	X	X	X	X
Severe Winter Weather/Cold	X	X	X	X	X	X	X
Sinkhole	X	-	-	X	-	-	-
Tornado	X	X	X	X	X	X	X
Wild Fire	X	X	X	X	X	X	X

### 3.1.5 Multi-Jurisdictional Risk Assessment

For this multi-jurisdictional plan, the risks are assessed for each jurisdiction where they deviate from the risks facing the entire planning area. The planning area is fairly uniform in terms of climate and topography as well as building construction characteristics. Accordingly, the geographic areas of occurrence for weather-related hazards do not vary greatly across the planning area for most hazards. The more urbanized areas within the planning area have more assets that are vulnerable to the weather-related hazards and varied development trends impact the future vulnerability. These differences are discussed in greater detail in the vulnerability sections of each hazard.

The hazards that have the potential to vary across the planning area in terms of geographic areas at risk include dam/levee failure, flash & riverine flooding, sinkhole, and wild fire.

## 3.2 Assets at Risk

This section assesses the population, structures, critical facilities, and other important assets in the planning area that may be at risk to hazards.

### 3.2.1 Total Exposure of Population and Structures

#### Unincorporated County and Incorporated Cities

In the following three tables, population data is based on 2017 Census Bureau data. Building counts are based on the University of Missouri Structures Count and building exposure values are HMPC and SEMO RPC estimates based on median home values in each jurisdiction. Contents exposure values were calculated by factoring a multiplier to the building exposure values based on usage type. The multipliers were derived from the HAZUS MH 2.1 and are defined below in Table 3.3. Land values have been purposely excluded from consideration because land remains following disasters, and subsequent market devaluations are frequently short term and difficult to quantify. Another reason for excluding land values is that state and federal disaster assistance programs generally do not address loss of land (other than crop insurance). It should be noted that this valuation methodology is an estimate only and will not equal other estimates or calculations (e.g. Assessor data) due to variations in the methodologies.

Table 3.3 shows the total population, building count, estimated value of buildings, estimated value of contents and estimated total exposure for the unincorporated county and each participating incorporated city. Table 3.4 that follows provides the building value exposures for the county and each participating city in the planning area broken down by usage type. Finally, Table 3.5 provides the building count total for the county and each participating city in the planning area broken out by building usage types (residential, commercial, industrial, and agricultural).

**Table 3.3. Maximum Population and Building Exposure by Jurisdiction - Communities**

Jurisdiction	2017 Population	Building Count	Building Exposure	Contents Exposure	Total Exposure
Unincorporated County	12,269	6,801	\$ 1,123,688,769	\$ 680,061,682	\$ 1,803,750,451
Bloomsdale	744	416	\$ 78,950,611	\$ 51,701,476	\$ 130,652,087
St. Mary	426	239	\$ 20,199,537	\$ 13,183,213	\$ 33,382,750
Ste. Genevieve	4,443	2,574	\$ 356,047,244	\$ 246,706,162	\$ 602,753,406
Total	17,882	10,029	\$ 1,578,886,160	\$ 991,652,532	\$ 2,570,538,693

Sources: Population, 2016 Census; Building Count, SEMO RPC data; Building Exposure, HMPC and SEMO RPC data; Contents Exposure derived by applying multiplier to Building Exposure based on HAZUS MH 2.1 standard contents multipliers per usage type as follows: Residential (50%), Commercial (100%), Industrial (150%), Agricultural (100%).

**Table 3.4. Building Values/Exposure by Usage Type**

Jurisdiction	Residential	Commercial	Industrial	Agricultural	Total
Unincorporated County	\$ 943,216,780	\$ 19,809,936	\$ 55,962,607	\$ 104,699,446	\$ 1,123,688,769
Bloomdsdale	\$ 59,955,512	\$ 12,321,502	\$ 5,457,241	\$ 1,216,356	\$ 78,950,611
St. Mary	\$ 15,252,878	\$ 3,490,976	\$ 1,220,230	\$ 235,453	\$ 20,199,537
Ste. Genevieve	\$ 249,024,732	\$ 75,167,020	\$ 30,342,568	\$ 1,512,925	\$ 356,047,244
Total	\$ 1,267,449,902	\$ 110,789,433	\$ 92,982,646	\$ 107,664,179	\$ 1,578,886,160

**Table 3.5. Building Counts by Usage Type**

Jurisdiction	2017 Population	Residential	Commercial	Industrial	Agricultural	Total
Unincorporated County	12,269	5,985	63	89	664	6,801
Bloomdsdale	744	363	37	8	7	416
St. Mary	426	208	24	4	3	239
Ste. Genevieve	4,443	2,167	327	66	13	2,574
Total	17,882	8,723	451	167	688	10,029

Based on the data that is available from the districts' completion of the Data Collection Questionnaire and district maintained websites, the number of enrolled students at the participating public school districts is provided in Table 3.6 below. Additional information includes the number of buildings, building values (building exposure) and contents value (contents exposure).

**Table 3.6. Population and Building Exposure by Jurisdiction-Public School Districts**

Public School District	Enrolment	Building Count	Building Exposure (\$)	Contents Exposure (\$)	Total Exposure (\$)
Ste. Genevieve R-II	1,850	13	65,000,000	8,000,000	73,000,000

Source: Enrollment - <http://mcids.dese.mo.gov/quickfacts/Pages/District-and-School-Information.aspx>. Building Count, Building Exposure, Contents Exposure, and Total Exposure amounts - Public School Districts.

---

### 3.2.2 Other Assets

---

Assessing the vulnerability of the planning area to disaster also requires data on the natural, historic, cultural, and economic assets of the area. This information is important for many reasons.

- These types of resources warrant more protection due to their unique and irreplaceable nature and contribution to the overall economy.
- Knowing about these resources in advance allows for consideration immediately following a hazard event, which is when the potential for damages is higher.
- The rules for reconstruction, restoration, rehabilitation, and/or replacement are often different for these types of designated resources.
- The presence of natural resources can reduce the impacts of future natural hazards, such as wetlands and riparian habitats which help absorb floodwaters.
- Losses to economic assets like these (e.g., major employers or primary economic sectors) could have severe impacts on a community and its ability to recover from disaster.

---

**Table 3.7. Threatened and Endangered Species in Ste. Genevieve County**

<b>Common Name</b>	<b>Scientific Name</b>	<b>Status</b>
<i>Birds</i>		
Least tern	<i>Sterna antillarum</i>	Endangered
Red knot	<i>Calidris canutus rufa</i>	Threatened
<i>Clams</i>		
Curtis pearlymussel	<i>Epioblasma florentina curtisii</i>	Endangered
Scaleshell mussel	<i>Leptodea leptodon</i>	Endangered
Snuffbox mussel	<i>Epioblasma triquetra</i>	Endangered
<i>Fishes</i>		
Pallid sturgeon	<i>Scaphirhynchus albus</i>	Endangered
<i>Mammals</i>		
Indiana bat	<i>Myotis sodalis</i>	Endangered
Gray bat	<i>Myotis grisescens</i>	Endangered
Northern Long-Eared Bat	<i>Myotis septentrionalis</i>	Threatened

Source: U.S. Fish and Wildlife Service

Although there are many structures in Ste. Genevieve County of significant historic importance, there are currently ten properties/sites in the county which are listed on the National Register of Historic Places. The county has two designated historic districts.

- Louis Bolduc House (listed April 16, 1969)
- Common Field Archeological Site (listed July 29, 1969)
- Jacques Dubreuil Guibourd House (listed May 21, 1969)

- 
- Kreilich Archeological Site (listed May 21, 1969)
  - Ste. Genevieve Historic Dist. (listed October 15, 1966)
  - Ste. Genevieve Historic Dist. (listed April 1, 2002)

These National Register properties, and other historic structures found in Ste. Genevieve County, are most vulnerable to damage which could be caused by earthquakes, tornadoes or severe thunderstorms.

## 3.3 Future Land Use and Development

---

### **County and Municipalities**

As discussed in previous chapters, Ste. Genevieve County and the city of Ste. Genevieve have experienced only small changes in population and new building starts. While Bloomsdale and St. Mary have seen substantial growths in population over the past five years, this growth rate is not expected to be sustainable, especially Bloomsdale's 40% growth rate. Rates of growth in these two communities are expected to slow to more sustainable rates similar to the rest of the county, with growth in the 2%-5% range. Given the area's rural nature there is little impact expected on hazards and mitigation actions due to future growth.

### **School District's Future Development**

The school district anticipates only minor changes in student population and do not expect any future building development in the next five years, with the exception of a saferoom, should funding become available.

### **Levee Districts**

Levee District No. 2, which protects mostly agricultural parts of the county, does not anticipate any significant development occurring within its protected area. Likewise, Levee District No. 3, which protects downtown Ste. Genevieve, does not anticipate any significant new development in the next five years as the downtown area is already developed.

---

## 3.4 Hazard Profiles, Vulnerability, and Problem Statements

---

Each hazard will be analyzed individually in a hazard profile. The profile will consist of a general hazard description, location, severity/magnitude/extent, previous events, future probability, a discussion of risk variations between jurisdictions, and how anticipated development could impact risk. At the end of each hazard profile will be a vulnerability assessment, followed by a summary problem statement.

### **Hazard Profiles**

The level of information presented in the profiles will vary by hazard based on the information available. With each update of this plan, new information will be incorporated to provide better evaluation and prioritization of the hazards that affect the planning area. Detailed profiles for each of the identified hazards include information categorized as follows:

**Hazard Description:** This section consists of a general description of the hazard and the types of impacts it may have on a community or school/special district.

**Geographic Location:** This section describes the geographic location of the hazard in the planning area. Where available, use maps to indicate the specific locations of the planning area that are vulnerable to the subject hazard. For some hazards, the entire planning area is at risk.

**Severity/Magnitude/Extent:** This includes information about the severity, magnitude, and extent of a hazard. For some hazards, this is accomplished with description of a value on an established scientific scale or measurement system, such as an EF2 tornado on the Enhanced Fujita Scale. Severity, magnitude, and extent can also include the speed of onset and the duration of hazard events. Describing the severity/magnitude/extent of a hazard is not the same as describing its potential impacts on a community. Severity/magnitude/extent defines the characteristics of the hazard regardless of the people and property it affects.

**Previous Occurrences:** This section includes available information on historic incidents and their impacts. Historic event records form a solid basis for probability calculations.

**Probability of Future Occurrence:** The frequency of recorded past events is used to estimate the likelihood of future occurrences. Probability was determined by dividing the number of recorded events by the number of years and multiplying by 100. This gives the percent chance of the event happening in any given year. For events occurring more than once annually, the probability will be reported 100% in any given year, with a statement of the average number of events annually.

### **Vulnerability Assessments**

Following the hazard profile for each hazard will be the vulnerability assessment. The vulnerability assessment further defines and quantifies populations, buildings, critical facilities, and other community assets at risk to damages from natural hazards. The vulnerability assessments will be based on the best available county-level data, which is in the Missouri Hazard Mitigation Plan (2013). The county-level assessments in the State Plan were based on the following sources:

- Statewide GIS data sets compiled by state and federal agencies; and
- FEMA's HAZUS-MH loss estimation software.

---

The vulnerability assessments in the plan will also be based on:

- Written descriptions of assets and risks provided by participating jurisdictions;
- Existing plans and reports;
- Personal interviews with planning committee members and other stakeholders; and
- Other sources as cited.

Detailed profiles for each of the identified hazards include information categorized as follows:

### **Vulnerability Overview**

This section consists of a general overview narrative of the planning area's vulnerability to the hazard. Within this section, the magnitude/severity of the hazard is discussed. The magnitude of the impact of a hazard event (past and perceived) is related directly to the vulnerability of the people, property, and the environment it affects. This is a function of when the event occurs, the location affected, the resilience of the community, and the effectiveness of the emergency response and disaster recovery efforts.

### **Potential Losses to Existing Development**

This section provides the potential losses to existing development. Where data is available, this section provides estimated financial losses as well as the methodology used. For hazards with an overall "Low" rating, potential losses may not be discussed.

### **Future Development**

This section provides information on how vulnerability to this hazard will be impacted by planned future development as well as information for jurisdictions to consider in planning future development.

### **Hazard Summary by Jurisdiction**

For hazards that vary by jurisdiction, this section will provide an overview of how the hazard varies, followed by a table indicating the probability, magnitude, warning time, and duration rankings for each jurisdiction with the resulting hazard score and level.

### **Problem Statement**

Provides a summary of the hazard's probability, potential impacts on each jurisdiction, and mitigating factors or actions being taken or considered.

### 3.4.1 Dam Failure

#### Hazard Profile

##### ***Hazard Description***

A dam is defined as a barrier constructed across a watercourse for storage, control, or diversion of water. Dams are typically constructed of earth, rock, concrete, or mine tailings. Dam failure is the uncontrolled release of impounded water resulting in downstream flooding, affecting both life and property. Dam failure can be caused by any of the following:

1. Overtopping - inadequate spillway design, debris blockage of spillways or settlement of the dam crest.
2. Piping: internal erosion caused by embankment leakage, foundation leakage and deterioration of pertinent structures appended to the dam.
3. Erosion: inadequate spillway capacity causing overtopping of the dam, flow erosion, and inadequate slope protection.
4. Structural Failure: caused by an earthquake, slope instability or faulty construction.

Dams in the NID are classified according to hazard potential, an indicator of the consequences of dam failure. A dam's hazard potential classification, presented in Table 3.10, does not indicate its condition. Dams assigned the high hazards potential classification are those where failure will potentially result in loss of human life. Significant hazard potential are those dams where failure results in no probable loss of human life but can cause economic loss. Dams assigned the low hazard potential classification are those where failure will result in no probable loss of human life and low economic or environmental losses. Losses are principally limited to the owner's property.

**Table 3.9. MDNR Dam Hazard Classification Definitions**

Hazard Class Definition	
Class I	The area downstream from the dam that would be affected by inundation contains ten (10) or more permanent dwellings or any public building. Inspections of these dams must occur every two years.
Class II	The area downstream from the dam that would be affected by inundation contains one to nine permanent dwellings, or one (1) or more campgrounds with permanent water, sewer and electrical services or one (1) or more industrial buildings. Inspections of these dams must occur once every three years.
Class III	The area downstream from the dam that would be affected by inundation does not contain any of the structures identified for Class I or Class II dams. Inspections of these dams must occur once every five years.

**Table 3.10. NID Dam Hazard Classification Definitions**

Hazard Class Definition	
Low Hazard	Failure results in only minimal property damage
Significant Hazard	Failure could possibly result in the loss of life and appreciable property damage
High Hazard	If the dam were to fail, lives would likely be lost and extensive property damage would result

Source: National Inventory of Dams

There is not a direct correlation between the State Hazard classification and the NID classifications. However,

---

most dams that are in the DNR's Class I and Class II are considered NID High Hazard Dams.

The following table shows the 51 National Inventory of Dams listing for Ste. Genevieve County.

**Table 3.11. National Inventory of Dams Listing**

Dam Name	NIDID	Hazard potential	Owner Type	NID Height (Ft.)	River	City	Distance

---

### ***Severity/Magnitude/Extent***

The severity/magnitude of dam failure would be similar in some cases to the impacts associated with flood events (see the flood hazard vulnerability analysis and discussion). Based on the hazard class definitions, failure of any of the High Hazard/Class I dams could result in a serious threat of loss of human life, serious damage to residential, industrial or commercial areas, public utilities, public buildings, or major transportation facilities. Catastrophic failure of any high hazard dams has the potential to result in greater destruction due to the potential speed of onset and greater depth, extent, and velocity of flooding. Note that for this reason, dam failures could flood areas outside of mapped flood hazards. Also note that inundation areas have not been mapped for these dams; however, the expected inundation area is generally considered greater than the SFHA near the dam, decreasing down to equaling the SFHA further from the dam, and then eventually lying within the SFHA.

### ***Previous Occurrences***

There have been no previous occurrences of dam failures in the past 25 years.

### ***Probability of Future Occurrence***

There are no documented dam failures in the county in the past 25 years. This makes a calculation of probability difficult. However, regulated dams are inspected regularly, which greatly reduces the chances of a failure.

## **Vulnerability**

### ***Vulnerability Overview***

According to the 2018 State Hazard Mitigation Plan, there are approximately 17 structures in the county vulnerable to a failure of a state-regulated dam. There are, of course, other non-regulated dams in the county, but estimates are difficult due to data limitations.

### ***Potential Losses to Existing Development: (including types and numbers, of buildings, critical facilities, etc.)***

The 2018 State Hazard Mitigation Plan estimates potential losses due to the failure of state-regulated dams at approximately \$923,000. As with the number of buildings exposed, it is difficult to make any estimates for non-regulated dams due to data limitations.

### ***Impact of Future Development***

Future development will be most prominent around the urbanized areas of the county, which have no major dams upstream. Therefore, over the next five years, little development is anticipated in the estimated inundation areas of local dams.

### ***Hazard Summary by Jurisdiction***

Development density (low) in the presumed inundation zones for all dams in the county are similar across the county. Only the county and the city of Ste. Genevieve would be impacted by a dam failure, as no other jurisdiction has any significant dam structures nearby.

## **Problem Statement**

Dam failures primarily pose a problem for unincorporated areas of the county, which are generally less densely populated and have far less commercial or industrial development. While this limits the magnitude of potential loss of life due to a dam failure, damage to homes and agricultural assets still represent significant problems for county residents. Continued inspection of dams will help alleviate the chance of dam failure, and future mapping of inundation areas will help identify what structures are vulnerable.

---

## 3.4.2 Drought

---

### **Hazard Profile**

#### ***Hazard Description***

Drought is generally defined as a condition of moisture levels significantly below normal for an extended period over a large area that adversely affects plants, animal life, and humans. A drought period can last for months, years, or even decades. There are four types of drought conditions relevant to Missouri, according to the State Plan, which are as follows.

- Meteorological drought is defined in terms of the basis of the degree of dryness (in comparison to some “normal” or average amount) and the duration of the dry period. A meteorological drought must be considered as region-specific since the atmospheric conditions that result in deficiencies of precipitation are highly variable from region to region.
- Hydrological drought is associated with the effects of periods of precipitation (including snowfall) shortfalls on surface or subsurface water supply (e.g., streamflow, reservoir and lake levels, ground water). The frequency and severity of hydrological drought is often defined on a watershed or river basin scale. Although all droughts originate with a deficiency of precipitation, hydrologists are more concerned with how this deficiency plays out through the hydrologic system. Hydrological droughts are usually out of phase with or lag the occurrence of meteorological and agricultural droughts. It takes longer for precipitation deficiencies to show up in components of the hydrological system such as soil moisture, streamflow, and ground water and reservoir levels. As a result, these impacts also are out of phase with impacts in other economic sectors.
- Agricultural drought focus is on soil moisture deficiencies, differences between actual and potential evaporation, reduced ground water or reservoir levels, etc. Plant demand for water depends on prevailing weather conditions, biological characteristics of the specific plant, its stage of growth, and the physical and biological properties of the soil.
- Socioeconomic drought refers to when physical water shortage begins to affect people.

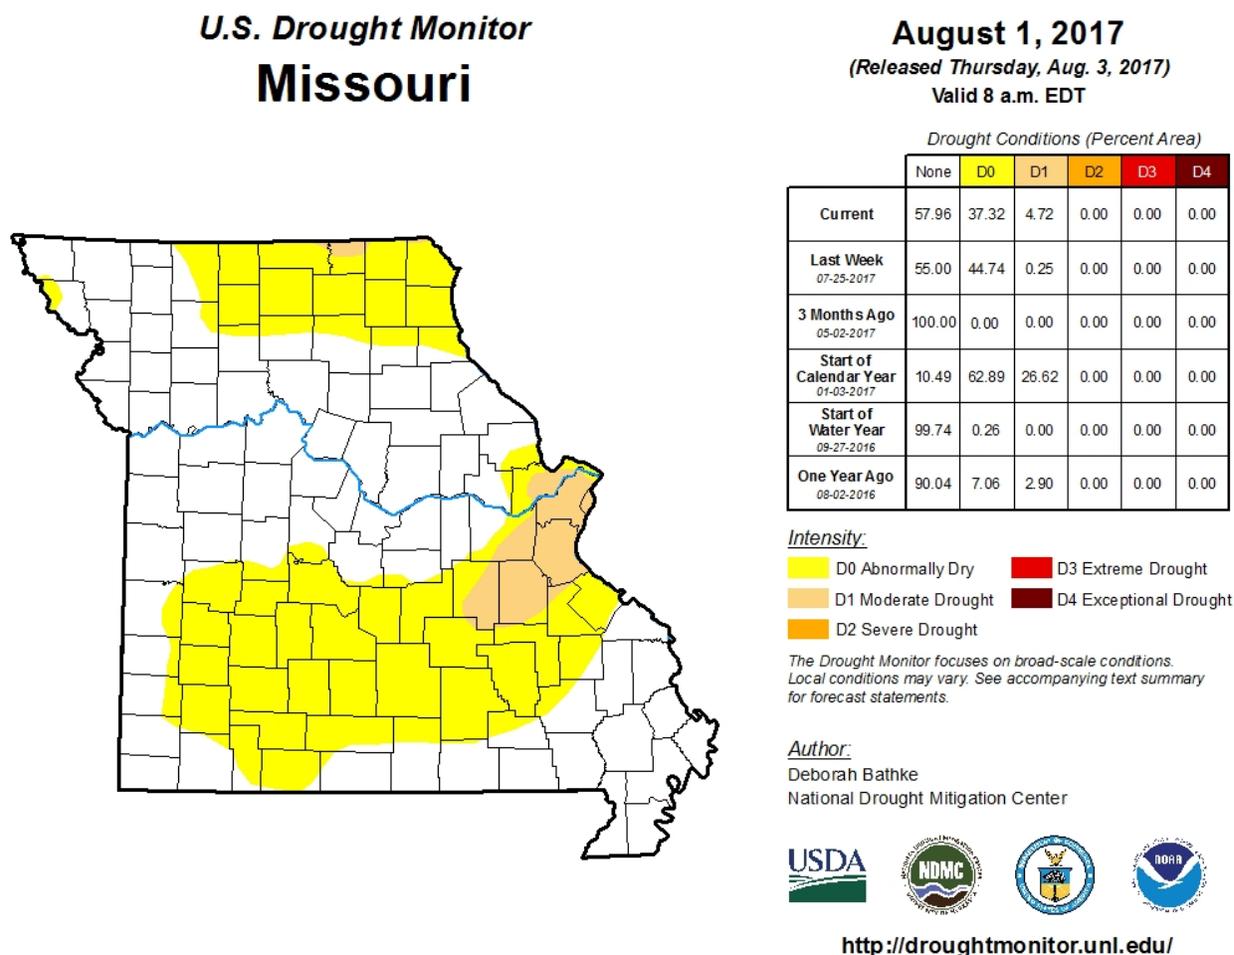

#### ***Geographic Location***

Given the nature of droughts, the entire county is equally exposed to this hazard. Droughts do tend to have greater impact on agricultural activities and would therefore have more impact in the unincorporated county than the more urbanized areas.

#### ***Severity/Magnitude/Extent***

The National Drought Monitor Center at the University of Nebraska at Lincoln summarized the potential severity of drought as follows. Drought can create economic impacts on agriculture and related sectors, including forestry and fisheries, because of the reliance of these sectors on surface and subsurface water supplies. In addition to losses in yields in crop and livestock production, drought is associated with increases in insect infestations, plant disease, and wind erosion. Droughts also bring increased problems with insects and disease to forests and reduce growth. The incidence of forest and range fires increases substantially during extended droughts, which in turn place both human and wildlife populations at higher levels of risk. Income loss is another indicator used in assessing the impacts of drought because so many sectors are affected. Finally, while drought is rarely a direct cause of death, the associated heat, dust and stress can all contribute to increased mortality.

Figure 3.1. U.S. Drought Monitor Map of Missouri on 8/1/2017

Source: U.S. Drought Monitor, <http://droughtmonitor.unl.edu/Home/StateDroughtMonitor.aspx?MO>

The Palmer Drought Indices measure dryness based on recent precipitation and temperature. The indices are based on a “supply-and-demand model” of soil moisture. Calculation of supply is relatively straightforward, using temperature and the amount of moisture in the soil. However, demand is more complicated as it depends on a variety of factors, such as evapotranspiration and recharge rates. These rates are harder to calculate. Palmer tried to overcome these difficulties by developing an algorithm that approximated these rates, and based the algorithm on the most readily available data — precipitation and temperature.

The Palmer Index has proven most effective in identifying long-term drought of more than several months. However, the Palmer Index has been less effective in determining conditions over a matter of weeks. It uses a “0” as normal, and drought is shown in terms of negative numbers; for example, negative 2 is moderate drought, negative 3 is severe drought, and negative 4 is extreme drought. Palmer’s algorithm also is used to describe wet spells, using corresponding positive numbers.

Palmer also developed a formula for standardizing drought calculations for each individual location based on the variability of precipitation and temperature at that location. The Palmer index can therefore be applied to

---

any site for which sufficient precipitation and temperature data is available.

### ***Previous Occurrences***

Since 1994, there have been 3 significant drought events to affect the county. The most severe was a months-long event in the summer of 2012.

### ***Probability of Future Occurrence***

Over the last 25 years there have been 3 major drought occurrences in the County. This equals a 12% annual chance of a drought.

## **Vulnerability**

### ***Vulnerability Overview***

Ste. Genevieve County has a medium vulnerability to drought compared to other areas of the State. The 2018 Missouri State Hazard Mitigation Plan indicates the county had \$337,545 in annualized crop insurance claims due to drought between 2007 and 2016.

### ***Potential Losses to Existing Development***

Much of the impact would be felt by agricultural activities, especially for crop related uses. Most of Ste. Genevieve County's agricultural land use is in crops, which contributes to the County's moderate annualized crop insurance claims and indicates that potential losses to existing development are likely to continue to be moderate during future events. Impacts on the cities and other districts will be far less significant.

### ***Impact of Future Development***

Given the small amount of growth the County is expected to experience over the next 5 years, impacts to future development will be almost identical to those on existing development.

### ***Hazard Summary by Jurisdiction***

All jurisdictions are equally exposed to a drought, but given the greater amount of agricultural activities in the County it has a greater vulnerability to drought than any of the other jurisdictions.

## **Problem Statement**

While droughts have regional impacts, within the county the most vulnerable areas are the agricultural assets in the unincorporated county. Droughts have little to no impact on the school and levee districts, and the municipalities have had no issues with water source depletion in recent history.

---

### 3.4.3 Earthquakes

---

#### **Hazard Profile**

##### ***Hazard Description***

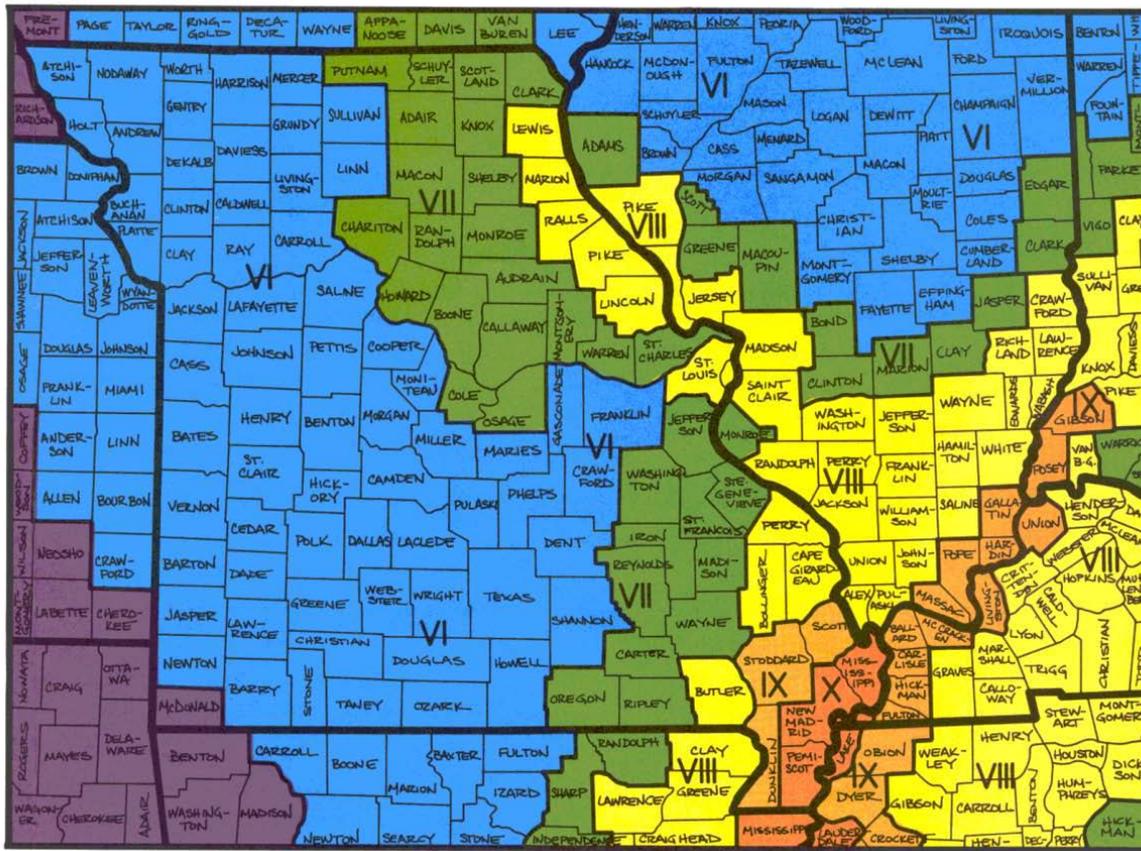

An earthquake is a sudden motion or trembling that is caused by a release of energy accumulated within or along the edge of the earth's tectonic plates. Earthquakes occur primarily along fault zones and tears in the earth's crust. Along these faults and tears in the crust, stresses can build until one side of the fault slips, generating compressive and shear energy that produces the shaking and damage to the built environment. Heaviest damage generally occurs nearest the earthquake epicenter, which is that point on the earth's surface directly above the point of fault movement. The composition of geologic materials between these points is a major factor in transmitting the energy to buildings and other structures on the earth's surface.

##### ***Geographic Location***

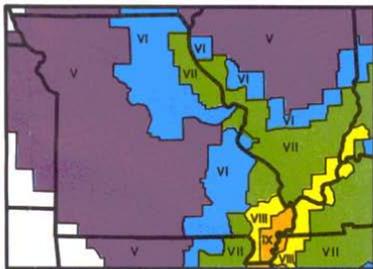

Ste. Genevieve County is located approximately 80 miles northwest of the New Madrid Fault. This fault was responsible for the famous 1811 earthquakes that registered up to 7.9 on the Richter Scale and rang church bells in Boston, MA.

The following Figures illustrate the potential impact the New Madrid Fault could have on the county.

**Figure 3.2. Impact Zones for Earthquake Along the New Madrid Fault**

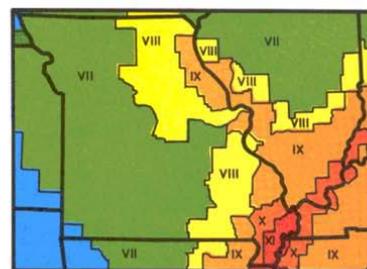

This map shows the highest projected Modified Mercalli intensities by county from a potential magnitude - 7.6 earthquake whose epicenter could be anywhere along the length of the New Madrid seismic zone.

This map shows the highest projected Modified Mercalli intensities by county from a potential magnitude - 6.7 earthquake whose epicenter could be anywhere along the length of the New Madrid seismic zone.

This map shows the highest projected Modified Mercalli intensities by county from a potential magnitude - 8.6 earthquake whose epicenter could be anywhere along the length of the New Madrid seismic zone.

## PROJECTED EARTHQUAKE INTENSITIES

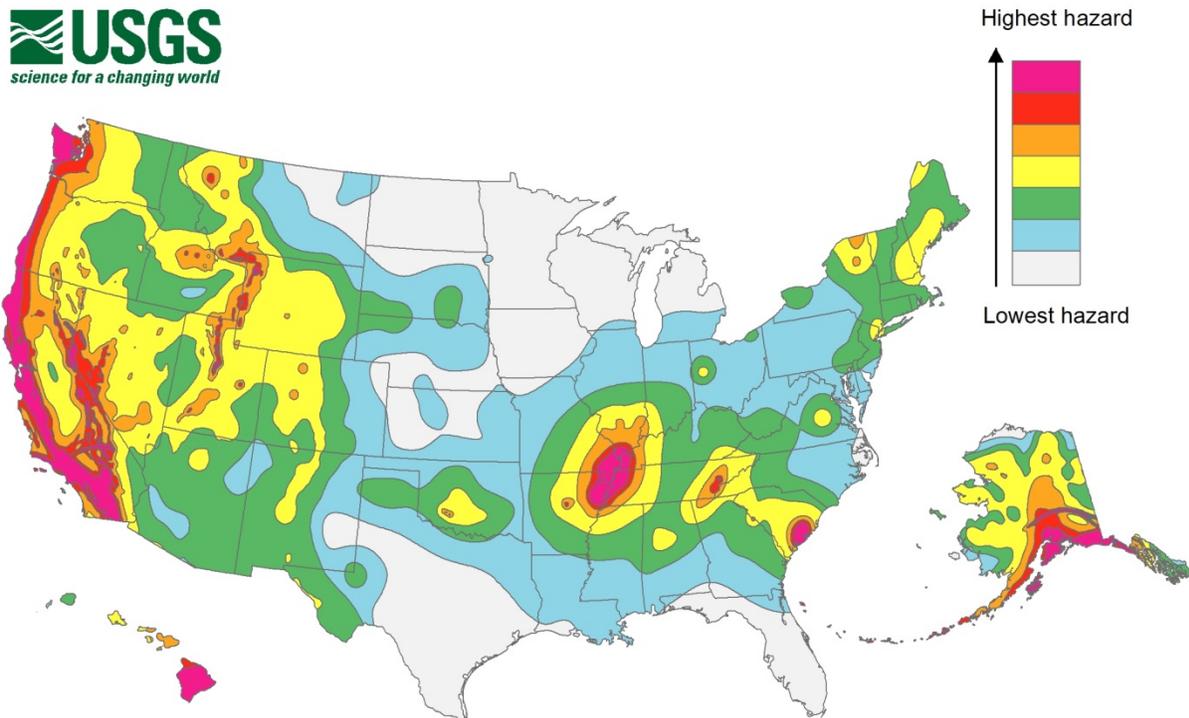

### MODIFIED MERCALLI INTENSITY SCALE

- I People do not feel any Earth movement.
- II A few people might notice movement.
- III Many people indoors feel movement. Hanging objects swing.
- IV Most people indoors feel movement. Dishes, windows, and doors rattle. Walls and frames of structures creak. Liquids in open vessels are slightly disturbed. Parked cars rock.
- V Almost everyone feels movement. Most people are awakened. Doors swing open or closed. Dishes are broken. Pictures on the wall move. Windows crack in some cases. Small objects move or are turned over. Liquids might spill out of open containers.
- VI Everyone feels movement. Poorly built buildings are damaged slightly. Considerable quantities of dishes and glassware, and some windows are broken. People have trouble walking. Pictures fall off walls. Objects fall from shelves. Plaster in walls might crack. Some furniture is overturned. Small bells in churches, chapels and schools ring.
- VII People have difficulty standing. Considerable damage in poorly built or badly designed buildings, adobe houses, old walls, spires and others. Damage is slight to moderate in well-built buildings. Numerous windows are broken. Weak chimneys break at roof lines. Cornices from towers and high buildings fall. Loose bricks fall from buildings. Heavy furniture is overturned and damaged. Some sand and gravel stream banks cave in.
- VIII Drivers have trouble steering. Poorly built structures suffer severe damage. Ordinary substantial buildings partially collapse. Damage slight in structures especially built to withstand earthquakes. Tree branches break. Houses not bolted down might shift on their foundations. Tall structures such as towers and chimneys might twist and fall. Temporary or permanent changes in springs and wells. Sand and mud is ejected in small amounts.
- IX Most buildings suffer damage. Houses that are not bolted down move off their foundations. Some underground pipes are broken. The ground cracks conspicuously. Reservoirs suffer severe damage.
- X Well-built wooden structures are severely damaged and some destroyed. Most masonry and frame structures are destroyed, including their foundations. Some bridges are destroyed. Dams are seriously damaged. Large landslides occur. Water is thrown on the banks of canals, rivers, and lakes. Railroad tracks are bent slightly. Cracks are opened in cement pavements and asphalt road surfaces.
- XI Few if any masonry structures remain standing. Large, well-built bridges are destroyed. Wood frame structures are severely damaged, especially near epicenters. Buried pipelines are rendered completely useless. Railroad tracks are badly bent. Water mixed with sand, and mud is ejected in large amounts.
- XII Damage is total, and nearly all works of construction are damaged greatly or destroyed. Objects are thrown into the air. The ground moves in waves or ripples. Large amounts of rock may move. Lakes are dammed, waterfalls formed and rivers are deflected.

Intensity is a numerical index describing the effects of an earthquake on the surface of the Earth, on man, and on structures built by man. The intensities shown in these maps are the highest likely under the most adverse geologic conditions. There will actually be a range in intensities within any small area such as a town or county, with the highest intensity generally occurring at only a few sites. Earthquakes of all three magnitudes represented in these maps occurred during the 1811 - 1812 "New Madrid earthquakes." The isoseismal patterns shown here, however, were simulated based on actual patterns of somewhat smaller but damaging earthquakes that occurred in the New Madrid seismic zone in 1843 and 1895.

Source: United States Geological Survey at [http://earthquake.usgs.gov/hazards/products/conterminous/2014/HazardMap2014\\_lg.jpg](http://earthquake.usgs.gov/hazards/products/conterminous/2014/HazardMap2014_lg.jpg)

### **Severity/Magnitude/Extent**

The extent or severity of earthquakes is generally measured in two ways: 1) the Richter Magnitude Scale is a measure of earthquake magnitude; and 2) the Modified Mercalli Intensity Scale is a measure of earthquake severity. The two scales are defined as follows.

#### *Richter Magnitude Scale*

The Richter Magnitude Scale was developed in 1935 as a device to compare the size of earthquakes. The magnitude of an earthquake is measured using a logarithm of the maximum extent of waves recorded by seismographs. Adjustments are made to reflect the variation in the distance between the various seismographs and the epicenter of the earthquakes. On the Richter Scale, magnitude is expressed in whole numbers and decimal fractions. For example, comparing a 5.3 and a 6.3 earthquake shows that the 6.3 quake is ten times bigger in magnitude. Each whole number increase in magnitude represents a tenfold increase in measured amplitude because of the logarithm. Each whole number step in the magnitude scale represents a release of approximately 31 times more energy.

#### *Modified Mercalli Intensity Scale*

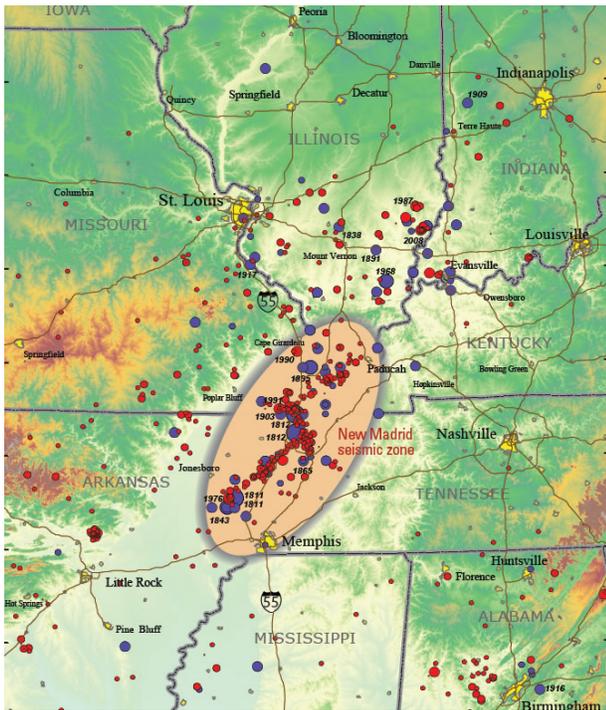

The intensity of an earthquake is measured by the effect of the earthquake on the earth's surface. The intensity scale is based on the responses to the quake, such as people awakening, movement of furniture, damage to chimneys, etc. The intensity scale currently used in the United States is the Modified Mercalli (MM) Intensity

Scale. It was developed in 1931 and is composed of 12 increasing levels of intensity. They range from imperceptible shaking to catastrophic destruction, and each of the twelve levels is denoted by a Roman numeral. The scale does not have a mathematical basis, but is based on observed effects. Its use gives the laymen a more meaningful idea of the severity.

### ***Previous Occurrences***

According to the NCEI, from 1811 to 1985 (most recently available dataset) there were 2,495 earthquakes in the State of Missouri. Additionally, earthquakes from 1699 through 2009 throughout the multi-state region are presented below (Figure 3.4). In recent years, according to the NCEI and USGS, there have been earthquakes recorded in the county ranging in magnitude from 1 to 3, but no known serious damage has resulted.

**Figure 3.4. Regional Historical Earthquakes, USGS**

The New Madrid Seismic Zone experiences more than 200 measurable earthquakes a year. Earthquakes of magnitude 2.5 to 3 on the Richter scale are felt annually, with a quake of 4 or more being released every 18 months. An earthquake of 5.0 or greater on the Richter scale occurs about once per decade.

### ***Probability of Future Occurrence***

As stated previously, the County typically experiences at least one earthquake per year, while an earthquake of 5.0 or greater on the Richter scale has an annual probability of approximately 10%.

## **Vulnerability**

### ***Vulnerability Overview***

Ste. Genevieve County has a higher than average loss ratio for earthquake damages compared to the rest of the State due to its close proximity to the New Madrid Seismic Zone.

### ***Potential Losses to Existing Development***

---

According to the 2018 State HMP, given a scenario of 2% probability of exceedance in 50 years, Ste. Genevieve County would be projected to suffer approximately \$484,000 in total economic loss to buildings. Such an economic loss in a rural county could be catastrophic and devastate the population for decades.

***Impact of Future Development***

Future development is not expected to increase the risk of an earthquake other than by contributing to the overall exposure of what could become damaged as a result of an event. Given the small growth anticipated in the County, even this increase in exposure is small.

***Hazard Summary by Jurisdiction***

Earthquake intensity will not vary in any meaningful way across the county; therefore, all jurisdictions are equally exposed to an earthquake, and the impacts are expected to be similar for all jurisdictions, given similar development patterns and types.

**Problem Statement**

Earthquakes pose a serious threat to all jurisdictions in the county. A sufficiently strong earthquake will likely damage numerous private and public structures and facilities, including utility distribution and supply infrastructure. The disruption to transportation, water, sewer, electricity, and natural gas will leave residents, businesses, and schools unable to function reliably for potentially weeks after the event. Seismic retrofitting can help, but is often cost prohibitive, and seismic requirements for new development can drive costs up and stymie the growth of communities. Emergency generators can help alleviate the potential loss of power presented by an event.

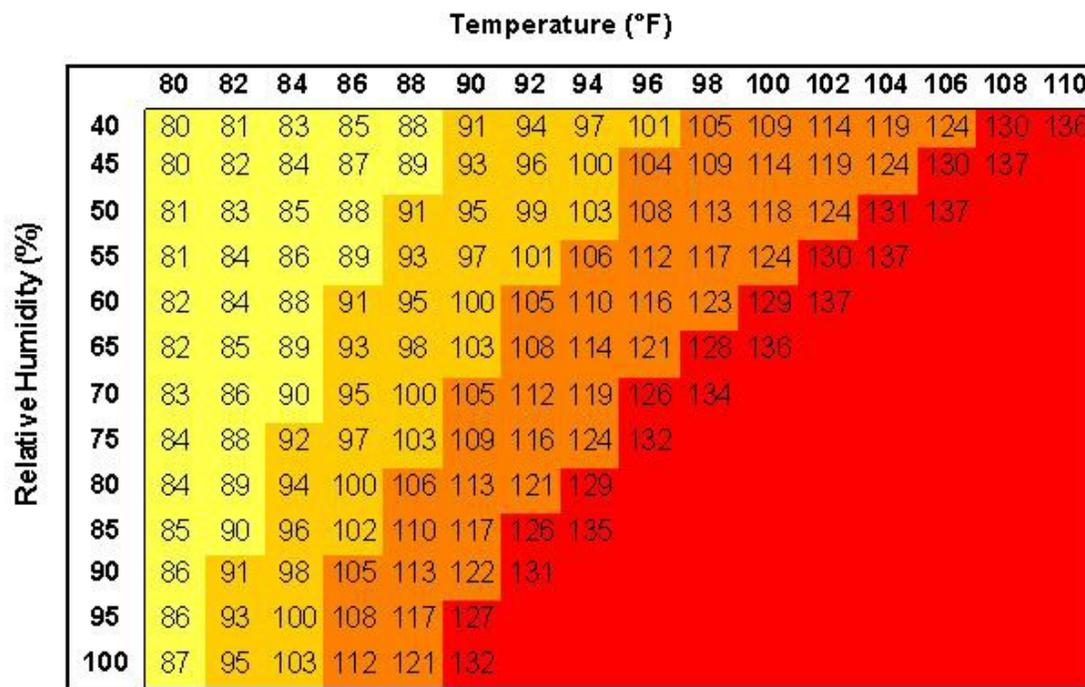

### 3.4.4 Extreme Heat

#### Hazard Profile

##### Hazard Description

Extreme temperature events, both hot and cold, can impact human health and mortality, natural ecosystems, agriculture and other economic sectors. The remainder of this section profiles extreme heat. Extreme cold events are profiled in combination with Winter Storm. According to information provided by FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Ambient air temperature is one component of heat conditions, with relative humidity being the other. The relationship of these factors creates what is known as the apparent temperature. The Heat Index chart shown in **Figure 3.5** uses both of these factors to produce a guide for the apparent temperature or relative intensity of heat conditions.

Figure 3.5. Heat Index (HI) Chart

#### Likelihood of Heat Disorders with Prolonged Exposure or Strenuous Activity

  Caution  
   Extreme Caution  
   Danger  
   Extreme Danger

Source: National Weather Service (NWS)

Note: Exposure to direct sun can increase Heat Index values by as much as 15°F. The shaded zone above 105°F corresponds to a HI that may cause increasingly severe heat disorders with continued exposure and/or physical activity.

#### Geographic Location

Extreme heat is an area-wide hazard event, the risk of extreme heat does not vary across the planning area.

#### Severity/Magnitude/Extent

Extreme heat can strain crops, livestock, and human health, as well as electricity delivery infrastructure overloaded during peak use of air conditioning during extreme heat events. Another type of infrastructure damage from extreme heat is road damage. When asphalt is exposed to prolonged extreme heat, it can cause buckling of asphalt-paved roads, driveways, and parking lots.

From 1988-2011, there were 3,496 fatalities in the U.S. attributed to summer heat. This translates to an annual national average of 146 deaths. Thankfully, during the same period, no deaths were recorded in the planning area, according to NCEI data. The National Weather Service stated that among natural hazards, no other natural disaster—not lightning, hurricanes, tornadoes, floods, or earthquakes—causes more deaths.

Those at greatest risk for heat-related illness include infants and children up to five years of age, people 65 years of age and older, people who are overweight, and people who are ill or on certain medications. However, even young and healthy individuals are susceptible if they participate in strenuous physical activities during hot weather. In agricultural areas, the exposure of farm workers, as well as livestock, to extreme temperatures is a major concern.

**Table 3.13** lists typical symptoms and health impacts due to exposure to extreme heat.

**Table 3.13. Typical Health Impacts of Extreme Heat**

Heat Index (HI)	Disorder
80-90° F (HI)	Fatigue possible with prolonged exposure and/or physical activity
90-105° F (HI)	Sunstroke, heat cramps, and heat exhaustion possible with prolonged exposure and/or physical activity
105-130° F (HI)	Heatstroke/sunstroke highly likely with continued exposure

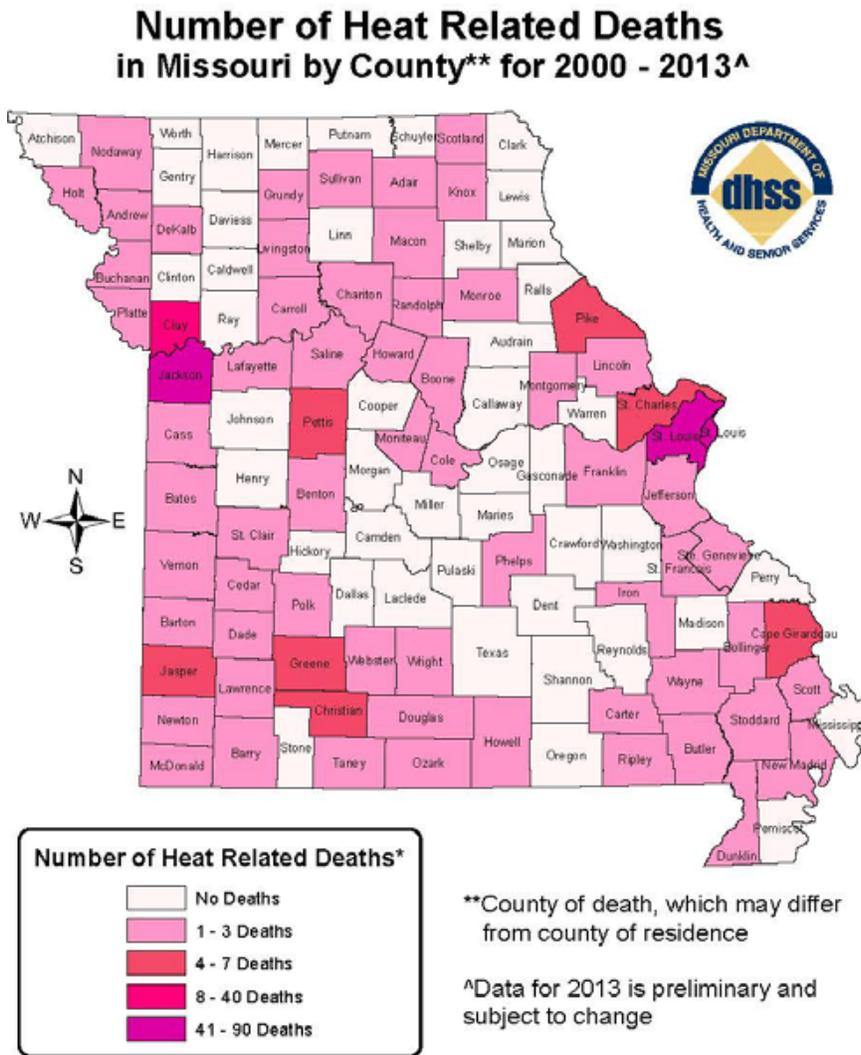

Source: National Weather Service Heat Index Program, [www.weather.gov/os/heat/index.shtml](http://www.weather.gov/os/heat/index.shtml)

The National Weather Service has an alert system in place (advisories or warnings) when the Heat Index is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. A common guideline for issuing excessive heat alerts is when for two or more consecutive days : (1) when the maximum daytime Heat Index is expected to equal or exceed 105 degrees Fahrenheit (°F); and the night time minimum Heat Index is 80°F or above. A heat advisory is issued when temperatures reach 105 degrees and a warning is issued at 115 degrees.

***Previous Occurrences***

The NCEI lists 22 recorded events in the past 25 years, with no deaths reported. However, Figure 3.5 shows there have been up to three heat-related deaths in the county between 2000 and 2013.

**Figure 3.6. Heat Related Deaths in Missouri 2000 - 2013**

\*Source: Bureau of Environmental Epidemiology

Date: 6/5/2014

***Probability of Future Occurrence***

While Extreme Heat events can potentially be under-reported in the NCEI, a total of 22 reported events in 25 years calculates to an annual probability of an event of 88%.

**Vulnerability**

***Vulnerability Overview***

The State HMP lists concentrations of elderly populations as one of the best indicators of vulnerability to extreme Heat events. For Ste. Genevieve County, the adults age 65 and older make up 16.7% of the population. This puts the County near the median of all counties in the state. This moderate percentage of elderly in the county, along with 1-3 reported deaths in the past 25 years due to extreme heat, indicate the county has a medium-high vulnerable to extreme heat events.

***Potential Losses to Existing Development***

---

Given the limited number of heat related deaths in the past quarter century and the median concentration of elderly in the County, the potential losses to existing development are minimal.

***Impact of Future Development***

Population growth can result in increases in the age-groups that are most vulnerable to extreme heat. Population growth also increases the strain on electricity infrastructure, as more electricity is needed to accommodate the growing population. While no jurisdictions are expected to experience major growth, the aging of the Baby Boomers is likely to lead to a growth in the percentage of elderly in the County.

***Hazard Summary by Jurisdiction***

Those at greatest risk for heat-related illness and deaths include children up to five years of age, people 65 years of age and older, people who are overweight, and people who are ill or on certain medications. To determine jurisdictions within the planning area with populations more vulnerable to extreme heat, demographic data was obtained from the 2017 census on population percentages in each jurisdiction comprised of those under age 5 and over age 65. Data was not available for overweight individuals and those on medications vulnerable to extreme heat. Table 3.14 below summarizes vulnerable populations in the participating jurisdictions. Note that school and special districts are not included in the table.

---

**Table 3.14. County Population Under Age 5 and Over Age 65, 2010 Census Data**

Jurisdiction	Population Under 5 yrs	Population 65 yrs and over
Ste. Genevieve County	5%	18%
Bloomsdale	6%	16%
St. Mary	6%	22%
Ste. Genevieve	8%	20%

Source: U.S. Census Bureau

**Problem Statement**

Extreme heat is most problematic for the elderly and youth in the entire county. While schools host much of the youth population for a period of time each day, the buildings are temperature controlled and offer a reprieve to students from the heat if they lack air conditioning at home. Likewise, the senior center offers an oasis for senior residents seeking a break from extreme heat.

---

## 3.4.5 Wildfires

---

### **Hazard Profile**

#### ***Hazard Description***

The incident types considered for wildfires include: 1) natural vegetation fire, 2) outside rubbish fire, 3) special outside fire, and 4) cultivated vegetation, crop fire.

The Missouri Division of Fire Safety (MDFS) indicates that approximately 80 percent of the fire departments in Missouri are staffed with volunteers. Whether paid or volunteer, these departments are often limited by lack of resources and financial assistance. The impact of a fire to a single-story building in a small community may be as great as that of a larger fire to a multi-story building in a large city.

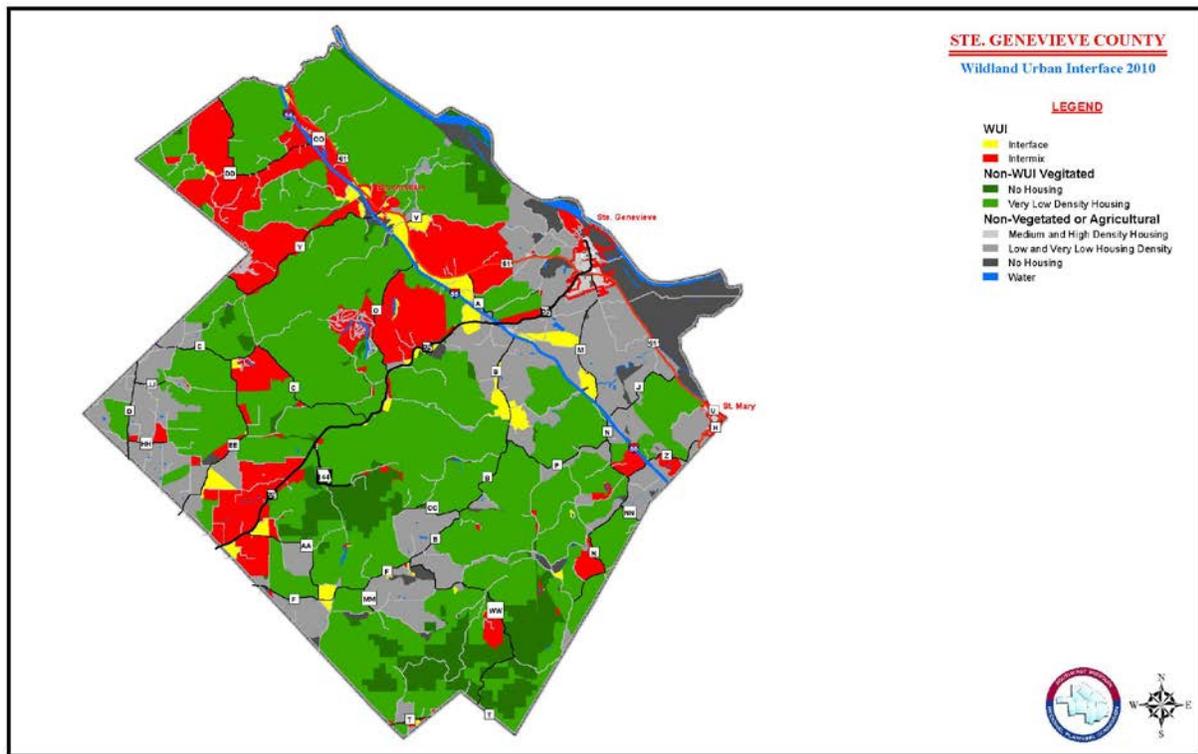

The Forestry Division of the Missouri Department of Conservation (MDC) is responsible for protecting privately owned and state-owned forests and grasslands from wildfires. To accomplish this task, eight forestry regions have been established in Missouri for fire suppression. The Forestry Division works closely with volunteer fire departments and federal partners to assist with fire suppression activities. Currently, more than 900 rural fire departments in Missouri have mutual aid agreements with the Forestry Division to obtain assistance in wildfire protection if needed.

Most of Missouri fires occur during the spring season between February and May. The length and severity of both structural and wildland fires depend largely on weather conditions. Spring in Missouri is usually characterized by low humidity and high winds. These conditions result in higher fire danger. In addition, due to the recent lack of moisture throughout many areas of the state, conditions are likely to increase the risk of wildfires. Drought conditions can also hamper firefighting efforts, as decreasing water supplies may not prove adequate for firefighting. It is common for rural residents burn their garden spots, brush piles, and other areas in the spring. Some landowners also believe it is necessary to burn their forests in the spring to promote grass growth, kill ticks, and reduce brush. Therefore, spring months are the most dangerous for wildfires. The second most critical period of the year is fall. Depending on the weather conditions, a sizeable number of fires may occur between mid-October and late November.

#### ***Geographic Location***

The risk of structural fire does not vary widely across the planning area. However, damages due to wildfires are likely to be higher in communities with more wildland–urban interface (WUI) areas. WUI refers to the zone of transition between unoccupied land and human development. Within the WUI, there are two specific areas identified: 1) Interface and 2) Intermix. The Interface areas are those areas that abut wildland vegetation and the Intermix areas are those areas that intermingle with wildland areas. Figure 3.7 illustrates the most vulnerable areas of the county based on Interface and Intermix.

Figure 3.7. Woodland-Urban Interface Map

### **Severity/Magnitude/Extent**

Wildfires damage the environment, killing some plants and occasionally animals. Firefighters have been injured or killed, and structures can be damaged or destroyed. The loss of plants can heighten the risk of soil erosion and landslides. Although Missouri wildfires are not the size and intensity of those in the Western United States, they could impact recreation and tourism in and near the fires.

Wildland fires in Missouri have been mostly a result of human activity rather than lightning or some other natural event. Wildfires in Missouri are usually surface fires, burning the dead leaves on the ground or dried grasses. They do sometimes “torch” or “crown” out in certain dense evergreen stands like eastern red cedar and shortleaf pine. However, Missouri does not have the extensive stands of evergreens found in the western US that fuel the large fire storms seen on television news stories.

While very unusual, crown fires can and do occur in Missouri native hardwood forests during prolonged periods of drought combined with extreme heat, low relative humidity, and high wind. Tornadoes, high winds, wet snow and ice storms in recent years have placed a large amount of woody material on the forest floor that causes wildfires to burn hotter and longer. These conditions also make it more difficult for fire fighters suppress fires safely. See <http://www.firewisemissouri.org/wildfire-in-missouri.html>

Often wildfires in Missouri go unnoticed by the general public because the sensational fire behavior that captures the attention of television viewers is rare in the state. Yet, from the standpoint of destroying homes and other property, Missouri wildfires can be quite destructive.

Information on severity of damages from wildfires is not currently available.

---

### ***Previous Occurrences***

The Missouri Department of Conservation lists 269 instances of wildfires in the county from 2010 to 2019, though only 43 of these burned 10 acres or more.

### ***Probability of Future Occurrence***

Based on 269 instances in 10 years, there is a 100% chance of a wildfire in the county in any given year.

## **Vulnerability**

### ***Vulnerability Overview***

While the 2018 State HMP does not make such a determination on a county by county basis, the 2013 State HMP indicated Ste. Genevieve County had a “Medium-High” vulnerability to wildfires. The woodland-urban interface map indicates this is likely true for the participating cities as well.

### ***Potential Losses to Existing Development***

The 2018 State HMP estimates the county has 4,797 structures vulnerable to a wildfire, with a value of \$993 million.

### ***Impact of Future Development***

Future development is most likely to occur in areas of Intermix on the WUI map. This will increase the number of structures in the area while also reducing the amount of vegetation to serve as fuel. These two factors are expected to balance one another, leading to no significant impact from future development.

### ***Hazard Summary by Jurisdiction***

There is a significant amount of “Intermix” area all throughout the county, indicating a greater vulnerability to wildfires. The County certainly has more forest cover than the cities, but the lower population density minimizes the impacts of a wildfire on human life and structures in the county.

## **Problem Statement**

Wildfires are a common occurrence in the county, though the vast majority of these events are small, impacting 5 acres or less. Approximately 1/3 of the historical events referenced above impacted less than 1 acre. However, any wildfire does pose the threat to grow quickly and impact a much larger area if not addressed quickly. Local fire departments are equipped and trained to handle these common events.

---

## 3.4.6 Flooding (Flash and River)

---

### **Hazard Profile**

#### ***Hazard Description***

A flood is partial or complete inundation of normally dry land areas. Riverine flooding is defined as the overflow of rivers, streams, drains, and lakes due to excessive rainfall, rapid snowmelt, or ice. There are several types of riverine floods, including headwater, backwater, interior drainage, and flash flooding. Riverine flooding is defined as the overflow of rivers, streams, drains, and lakes due to excessive rainfall, rapid snowmelt or ice melt. The areas adjacent to rivers and stream banks that carry excess floodwater during rapid runoff are called floodplains. A floodplain is defined as the lowland and relatively flat area adjoining a river or stream. The terms “base flood” and “100- year flood” refer to the area in the floodplain that is subject to a one percent or greater chance of flooding in any given year. Floodplains are part of a larger entity called a basin, which is defined as all the land drained by a river and its branches.

Flooding caused by dam and levee failure is discussed in the Dam and Levee Failure section. It will not be addressed in this section.

A flash flood occurs when water levels rise at an extremely fast rate because of intense rainfall over a brief period, sometimes combined with rapid snowmelt, ice jam release, frozen ground, saturated soil, or impermeable surfaces. Flash flooding can happen in Special Flood Hazard Areas (SFHAs) as delineated by the National Flood Insurance Program (NFIP), and can also happen in areas not associated with floodplains.

Ice jam flooding is a form of flash flooding that occurs when ice breaks up in moving waterways, and then stacks on itself where channels narrow. This creates a natural dam, often causing flooding within minutes of the dam formation.

In some cases, flooding may not be directly attributable to a river, stream, or lake overflowing its banks. Rather, it may simply be the combination of excessive rainfall or snowmelt, saturated ground, and inadequate drainage. With no place to go, the water will find the lowest elevations – areas that are often not in a floodplain. This type of flooding, often referred to as sheet flooding, is becoming increasingly prevalent as development outstrips the ability of the drainage infrastructure to properly carry and disburse the water flow.

Most flash flooding is caused by slow-moving thunderstorms or thunderstorms repeatedly moving over the same area. Flash flooding is a dangerous form of flooding which can reach full peak in only a few minutes. Rapid onset allows little or no time for protective measures. Flash flood waters move at very fast speeds and can move boulders, tear out trees, scour channels, destroy buildings, and obliterate bridges. Flash flooding can result in higher loss of life, both human and animal, than slower developing river and stream flooding.

In certain areas, aging storm sewer systems are not designed to carry the capacity currently needed to handle the increased storm runoff. Typically, the result is water backing into basements, which damages mechanical systems and can create serious public health and safety concerns. This combined with rainfall trends and rainfall extremes all demonstrate the high probability, yet generally unpredictable nature of flash flooding in the planning area.

Although flash floods are somewhat unpredictable, there are factors that can point to the likelihood of flash floods occurring. Weather surveillance radar is being used to improve monitoring capabilities of intense rainfall. This, along with knowledge of the watershed characteristics, modeling techniques, monitoring, and advanced warning systems has increased the warning time for flash floods.

---

***Geographic Location***

River flooding is most likely to occur in SFHAs. The following maps illustrate the SFHAs for the participating jurisdictions.

Figure 3.8.

Ste. Genevieve County SFHAs

## Severity/Magnitude/Extent

Missouri has a long and active history of flooding over the past century, according to the 2013 State Hazard Mitigation Plan. Flooding along Missouri's major rivers generally results in slow-moving disasters. River crest levels are forecast several days in advance, allowing communities downstream sufficient time to take protective measures, such as sandbagging and evacuations. Nevertheless, floods exact a heavy toll in terms of human suffering and losses to public and private property. By contrast, flash flood events in recent years have caused a higher number of deaths and major property damage in many areas of Missouri.

Flooding presents a danger to life and property, often resulting in injuries, and in some cases, fatalities. Floodwaters themselves can interact with hazardous materials. Hazardous materials stored in large containers could break loose or puncture because of flood activity. Examples are bulk propane tanks. When this happens, evacuation of citizens is necessary.

Public health concerns may result from flooding, requiring disease and injury surveillance. Community sanitation to evaluate flood-affected food supplies may also be necessary. Private water and sewage sanitation could be impacted, and vector control (for mosquitoes and other entomology concerns) may be necessary.

When roads and bridges are inundated by water, damage can occur as the water scours materials around bridge abutments and gravel roads. Floodwaters can also cause erosion undermining road beds. In some instances, steep slopes that are saturated with water may cause mud or rock slides onto roadways. These damages can cause costly repairs for state, county, and city road and bridge maintenance departments. When sewer back-up occurs, this can result in costly clean-up for home and business owners as well as present a health hazard.

### National Flood Insurance Program (NFIP) Participation

Table 3.15 shows the participation status of all jurisdictions in the planning area, regardless of participation status in this plan. Note that Bloomsdale is sanctioned (currently not participating in the NFIP but a Flood Hazard Boundary Map or Flood Insurance Rate Map has been issued). Bloomsdale leaders believe NFIP participation is not warranted due to the small potentially-impacted area and have chosen not to participate in the NFIP. Table 3.16 shows the NFIP policy and claim statistics of participating jurisdictions of this plan.

**Table 3.15. NFIP Participation**

Community ID #	Community Name	NFIP Participant (Y/N)	Current Effective Map Date	Regular-Emergency Program Entry Date
290833B	Ste. Genevieve County	Y	2/15/19	4/03/87

### ***Repetitive Loss/Severe Repetitive Loss Properties***

Repetitive Loss Properties, according to the State Hazard Mitigation Officer, are those properties with at least two flood insurance payments of \$1,000 or more in a 10 year period.

Severe Repetitive Loss Properties are defined, by the National Flood Insurance Reform Act of 2004, as: a single family property (consisting of 1 to 4 residences) that is covered under flood insurance by the NFIP and has incurred flood-related damage for which 4 or more separate claims payments have been paid under flood insurance coverage, with the amount of each claim payment exceeding \$5,000 and with cumulative amount of such claims payments exceeding \$20,000; or for which at least 2 separate claims payments have been made with the cumulative amount of such claims exceeding the reported value of the property.

The SRL data was obtained from the 2018 MO State Hazard Mitigation Plan and the RL data was provided by SEMA and current as of 9/30/2019; however at the time of request, the state was unable to obtain more recent data and could not provide property type data due to Federal data restrictions..

**Table 3.17. Repetitive Loss Properties**

Community Name	Total Losses	Properties	Total Building Payments	Total Content Payments	Total Payments	Average Payments
County Total	464	130	\$3,269,143	\$1,079,484	\$4,348,627	\$9,372
St. Mary	46	16	\$337,754	\$34,765	\$372,519	\$8,098
Ste. Genevieve County	19	5	\$246,555	\$32,216	\$278,771	\$14,672

### ***Probability of Future Occurrence***

For flash flood events, NCEI reports 14 events in the past 25 years, equaling an annual chance of 56%. Only two events resulted in damages or losses, equaling an 8% chance of occurrence in a year, with annualized damages of \$12,800. For river flooding, there are 6 reported event in the past 25 years, for an annual chance of 24%. There were two events in that time with property damage, equaling an 8% chance, with annualized property damage of \$440 per year. In that same time, the same two events also had crop damage reported, again equaling an 8% chance per year. However, due to the flooding of agricultural land, the crop damage from these two events equaled \$3.8 million, equaling an annualized rate of \$152,000 per year.

## **Vulnerability**

### ***Vulnerability Overview***

The County has extensive amounts of areas designated as SFHAs, the majority of which is along the Mississippi river. While much of the agricultural development is protected by the levee systems, levee failures have occurred, leading to significant crop damage. The St. Mary and Ste. Genevieve have significant amounts of SFHA with in their boundaries, while Bloomsdale has only a small amount.

### ***Potential Losses to Existing Development***

Table 3.21 shows the number of buildings in the floodplain in the participating jurisdictions. The table also

shows the value of those buildings and their contents.

The school district has no structures in floodplains. The levee districts, by their very nature, have structures in the floodplains, including the levees themselves, as well as pump houses and other maintenance structures.

**Table 3.21. Maximum Potential Flood Losses**

Jurisdiction	Building Count	Building Exposure	Contents Exposure	Total Exposure
Unincorporated County	355	\$ 58,662,859	\$ 35,503,036	\$ 94,165,894
Bloomdsdale	-	-	-	-
St. Mary	28	\$ 2,358,093	\$ 1,539,008	\$ 3,897,101
Ste. Genevieve	263	\$ 36,434,800	\$ 25,245,778	\$ 61,680,578
Total	646	\$ 97,455,752	\$ 62,287,821	\$ 159,743,573

Sources: Population, 2016 Census; Building Count, SEMO RPC data; Building Exposure, HMPC and SEMO RPC data; Contents Exposure derived by applying multiplier to Building Exposure based on HAZUS MH 2.1 standard contents multipliers per usage type as follows: Residential (50%), Commercial (100%), Industrial (150%), Agricultural (100%).

***Impact of Future Development***

Future development which occurs in floodplains, low-lying areas near rivers or streams or where drainage systems are not adequate to provide drainage during heavy rainfall events will face a much higher risk of flooding. Additionally, future development will also increase impervious surfaces, leading to additional run off, putting more strain on existing drainage systems.

***Hazard Summary by Jurisdiction***

GIS analysis of data from the University of Missouri of structures in the County indicates the County has approximately 95 residences, 8 commercial structures, 9 industrial structures, and 243 agricultural structures in SFHAs. The city of St. Mary has approximately 18 residences, 8 commercial structures, and 2 industrial structures in SFHAs. Ste. Genevieve has approximately 160 residences, 87 commercial structures, and 16 industrial structures in flood areas. The city of Bloomdsdale has no SFHA.

The school district has no structures in the floodplain.

**Problem Statement**

Due to the hilly terrain of the county, flood prone areas are primarily relegated to limited areas immediately adjacent to the county’s rivers, except for the floodplain area along the Mississippi River which is very extensive. St. Mary and Ste. Genevieve have significant development in the SFHAs, though all three jurisdictions do currently limit development in SFHAs. Other than roadways, there is no critical infrastructure in the SFHA.

---

## 3.4.7 Sinkholes

---

### **Hazard Profile**

#### ***Hazard Description***

Sinkholes are common where the rock below the land surface is limestone, carbonate rock, salt beds, or rocks that naturally can be dissolved by ground water circulating through them. As the rock dissolves, spaces and caverns develop underground. The sudden collapse of the land surface above them can be dramatic and range in size from broad, regional lowering of the land surface to localized collapse. However, the primary causes of most subsidence are human activities: underground mining of coal, groundwater or petroleum withdrawal, and drainage of organic soils. In addition, sinkholes can develop as a result of subsurface void spaces created over time due to the erosion of subsurface limestone (karst).

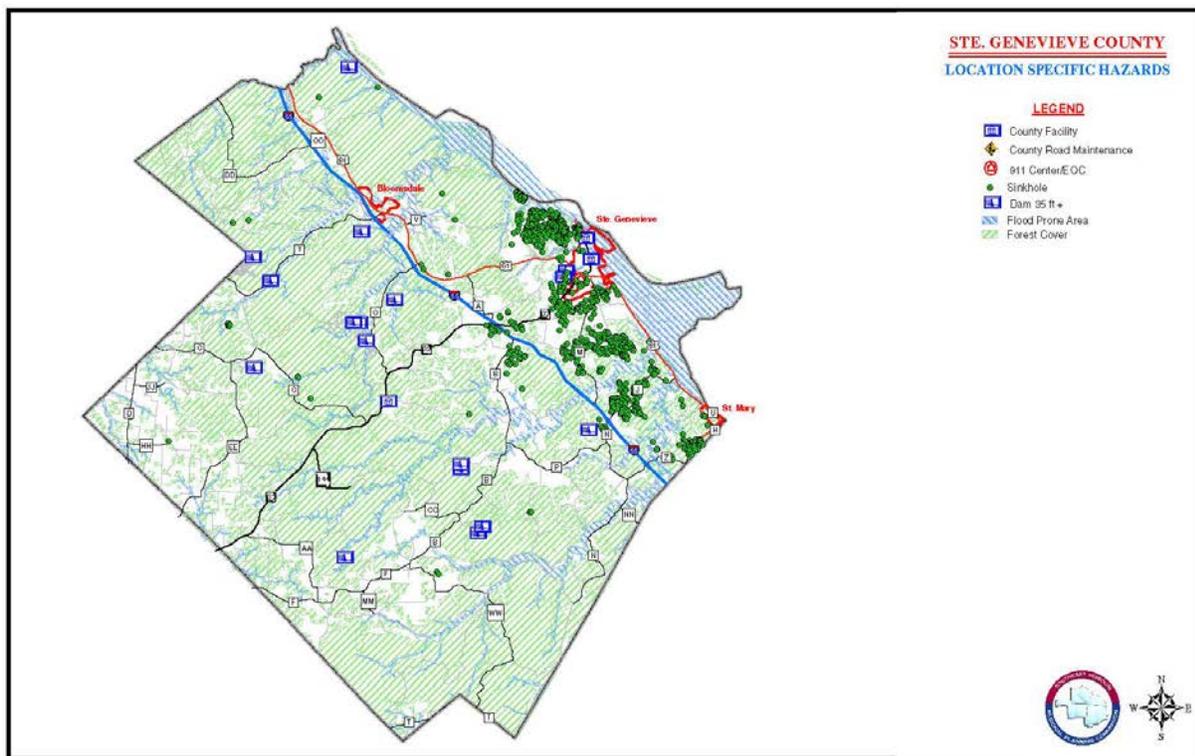

In the case of sinkholes, the rock below the surface is rock that has been dissolving by circulating groundwater. As the rock dissolves, spaces and caverns form, and ultimately the land above the spaces collapse. In Missouri, sinkhole problems are usually a result of surface materials above openings into bedrock caves eroding and collapsing into the cave opening. These collapses are called “cover collapses” and geologic information can be applied to predict the general regions where collapse will occur. Sinkholes range in size from several square yards to hundreds of acres and may be quite shallow or hundreds of feet deep.

According to the U.S. Geological Survey (USGS), the most damage from sinkholes tends to occur in Florida, Texas, Alabama, Missouri, Kentucky, Tennessee, and Pennsylvania. Fifty-nine percent of Missouri is underlain by thick, carbonate rock that makes Missouri vulnerable to sinkholes. Sinkholes occur in Missouri on a fairly frequent basis. Most of Missouri’s sinkholes occur naturally in the State’s karst regions (areas with soluble bedrock). They are a common geologic hazard in southern Missouri, but also occur in the central and northeastern parts of the State. Missouri sinkholes have varied from a few feet to hundreds of acres and from less than one to more than 100 feet deep. The largest known sinkhole in Missouri encompasses about 700 acres in western Boone County southeast of where Interstate 70 crosses the Missouri River. Sinkholes can also vary in shape like shallow bowls or saucers whereas other have vertical walls. Some hold water and form natural ponds.

#### ***Geographic Location***

Sinkholes in the county are heavily concentrated to the area east of I-55 and west of the Mississippi floodplain. Other locations in the county have single sinkholes. The locations of all known sinkholes in the county are shown in Figure 3.13.

**Figure 3.13. Sinkhole Locations**

***Severity/Magnitude/Extent***

Sinkholes vary in size and location, and these variances will determine the impact of the hazard. A sinkhole could result in the loss of a personal vehicle, a building collapse, or damage to infrastructure such as roads, water, or sewer lines. Groundwater contamination is also possible from a sinkhole. Because of the relationship of sinkholes to groundwater, pollutants captured or dumped in sinkholes could affect a community’s groundwater system. Sinkhole collapse could be triggered by large earthquakes. Sinkholes located in floodplains can absorb floodwaters but make detailed flood hazard studies difficult to model.

The 2018 State Plan included only seven documented sinkhole “notable events”. The plan stated that sinkholes are common to Missouri and the probability is high that they will occur in the future. To date, Missouri sinkholes have historically not had major impacts on development nor have they caused serious damage. Thus, the severity of future events is likely to be low.

***Previous Occurrences***

While there are 734 known sinkholes in the County, there have been no significant events related to them.

***Probability of Future Occurrence***

It is difficult to predict the probability of future occurrence of sinkholes given the complexities involved with bedrock conditions and the unknown “start” dates of the existing sinkholes. Given the karst topography of the county additional sinkholes are likely to occur eventually.

**Vulnerability**

---

### ***Vulnerability Overview***

With 734 known sinkholes but no significant events associated with them, the County's vulnerability to such events is low.

### ***Potential Losses to Existing Development***

There are no structures in the county within 100 ft. of a known sinkhole. The occurrence of new sinkholes is possible, but it is virtually impossible to predict the exact location at this time, making potential losses impractical to estimate.

### ***Impact of Future Development***

Additional future development will statistically increase the risk of damage to development, though not in any significant amount.

### ***Hazard Summary by Jurisdiction***

Sinkholes, while present and possible, pose little threat to any jurisdictions.

### **Problem Statement**

Sinkholes do occur in concentrated areas of the county. Development of new sinkholes is likely to occur, but there is no way to predict precisely where, though they are likely to occur in the areas near existing sinkholes, or to what magnitude.

---

## 3.4.8 Levee Failure

---

### **Hazard Profile**

#### ***Hazard Description***

Levees are earth embankments constructed along rivers and coastlines to protect adjacent lands from flooding. Floodwalls are concrete structures, often components of levee systems, designed for urban areas where there is insufficient room for earthen levees. When levees and floodwalls and their appurtenant structures are stressed beyond their capabilities to withstand floods, levee failure can result in injuries and loss of life, as well as damages to property, the environment, and the economy.

Levees can be small agricultural levees that protect farmland from high-frequency flooding. Levees can also be larger, designed to protect people and property in larger urban areas from less frequent flooding events such as the 100-year and 500-year flood levels. For purposes of this discussion, levee failure will refer to both overtopping and breach as defined in FEMA's Publication "So You Live Behind a Levee" (<http://content.asce.org/ASCELeveeGuide.html>). Following are the FEMA publication descriptions of different kinds of levee failure:

#### **Overtopping: When a Flood Is Too Big**

Overtopping occurs when floodwaters exceed the height of a levee and flow over its crown. As the water passes over the top, it may erode the levee, worsening the flooding and potentially causing an opening, or breach, in the levee.

#### **Breaching: When a Levee Gives Way**

A levee breach occurs when part of a levee gives way, creating an opening through which floodwaters may pass. A breach may occur gradually or suddenly. The most dangerous breaches happen quickly during periods of high water. The resulting torrent can quickly swamp a large area behind the failed levee with little or no warning.

Earthen levees can be damaged in several ways. For instance, strong river currents and waves can erode the surface. Debris and ice carried by floodwaters—and even large objects such as boats or barges—can collide with and gouge the levee. Trees growing on a levee can blow over, leaving a hole where the root wad and soil used to be. Burrowing animals can create holes that enable water to pass through a levee. If severe enough, any of these situations can lead to a zone of weakness that could cause a levee breach. In seismically active areas, earthquakes and ground shaking can cause a loss of soil strength, weakening a levee and possibly resulting in failure. Seismic activity can also cause levees to slide or slump, both of which can lead to failure.

#### ***Geographic Location***

Missouri is a state with many levees. Currently, there is no single comprehensive inventory of levee systems in the state. Levees have been constructed across the state by public entities and private entities with varying levels of protection, inspection oversight, and maintenance. The lack of a comprehensive levee inventory is not unique to Missouri.

There are two concurrent nation-wide levee inventory development efforts, one led by the United State Army Corps of Engineers (USACE) and one led by Federal Emergency Management Agency (FEMA). The National Levee Database (NLD), developed by USACE, captures all USACE related levee projects, regardless of design levels of protection. The Midterm Levee Inventory (MLI), developed by FEMA, captures all levee data (USACE and non-USACE) but primarily focuses on levees that provide 1% annual-chance flood protection on FEMA Flood Insurance Rate Maps (FIRMs).

---

It is likely that agricultural levees and other non-regulated levees within the planning area exist that are not inventoried or inspected. These levees that are not designed to provide protection from the 1-percent annual chance flood would overtop or fail in the 1-percent annual chance flood scenario. Therefore, any associated losses would be taken into account in the loss estimates provided in the Flood Hazard Section.

There are two levees listed in the USACE NLD in the County, Levee District No. 2, and Levee District No. 3.

Per the NLD, “the Sainte Genevieve No.2 Levee System reduces the risk of flooding from the Mississippi River to the Sainte Genevieve County, MO. The system was privately constructed and locally operated and maintained by the nonfederal Sponsor, Sainte Genevieve County Levee District No. 2. Levee system construction began in 1978, and the levee consists of over 11 miles of earthen embankment along the Mississippi River. The nearly 7,700-acre leveed area is primarily agricultural bottomland. The system reduces flood risk to a few residences, productive agricultural land, and four miles of rail line.”

Per the NLD, “the Sainte Genevieve No.3 Levee System reduces the risk of flooding from the Mississippi River to the community of Sainte Genevieve, MO. The system is federally authorized and constructed and locally operated and maintained by the nonfederal Sponsor, Sainte Genevieve County Levee District No. 3. The levee system was completed in 2001 and consists of 3.5 miles of earthen embankment along the Mississippi River. Within the nearly 970-acre leveed area are important archaeological sites, agricultural bottomland, and Ste. Genevieve’s Historic District, which includes the Louis Bolduc House a National Historic Landmark built in 1792. This system provides benefits to approximately 740 residents and approximately \$37 million in property. During the 2016 flood event, it is estimated that the system prevented \$14 million in flood damages.”

### ***Severity/Magnitude/Extent***

Levee failure is typically an additional or secondary impact of another disaster such as flooding or earthquake. The main difference between levee failure and losses associated with riverine flooding is magnitude. Levee failure often occurs during a flood event, causing destruction in addition to what would have been caused by flooding alone. In addition, there would be an increased potential for loss of life due to the speed of onset and greater depth, extent, and velocity of flooding due to levee breach.

As previously mentioned, agricultural levees and levees that are not designed to provide flood protection from at least the 1-percent annual chance flood likely do exist in the planning area. However, none of these levees are shown on the Preliminary DFIRM, nor are they enrolled in the USACE Levee Safety Program. As a result, an inventory of these types of levees is not available for analysis. Additionally, since these types of levees do not provide protection from the 1-percent annual chance flood, losses associated with overtopping or failure are captured in the Flood Section of this plan.

The USACE regularly inspects levees within its Levee Safety Program to monitor their overall condition, identify deficiencies, verify that maintenance is taking place, determine eligibility for federal rehabilitation assistance (in accordance with P.L. 84-99), and provide information about the levees on which the public relies. Inspection information also contributes to effective risk assessments and supports levee accreditation decisions for the National Flood Insurance Program administered by the Federal Emergency Management Agency (FEMA).

The USACE now conducts two types of levee inspections. Routine Inspection is a visual inspection to verify and rate levee system operation and maintenance. It is typically conducted each year for all levees in the USACE Levee Safety Program. Periodic Inspection is a comprehensive inspection led by a professional engineer and conducted by a USACE multidisciplinary team that includes the levee sponsor. The USACE typically conducts this inspection every five years on the federally authorized levees in the USACE Levee Safety Program.

Both Routine and Periodic Inspections result in a rating for operation and maintenance. Each levee segment receives an overall segment inspection rating of Acceptable, Minimally Acceptable, or Unacceptable. Figure 3.14 below defines the three ratings.

**Figure 3.14. Definitions of the Three Levee System Ratings**

Levee System Inspection Ratings

Acceptable	All inspection items are rated as Acceptable.
Minimally Acceptable	One or more levee segment inspection items are rated as Minimally Acceptable or one or more items are rated as Unacceptable and an engineering determination concludes that the Unacceptable inspection items would not prevent the segment/system from performing as intended during the next flood event.
Unacceptable	One or more levee segment inspection items are rated as Unacceptable and would prevent the segment/system from performing as intended, or a serious deficiency noted in past inspections (previous Unacceptable items in a Minimally Acceptable overall rating) has not been corrected within the established timeframe, not to exceed two years.

***Previous Occurrences***

Levee Dist. No. 2

Per the NLD, “during the Flood of 1993 and again in early 2016, failure from overtopping resulted in extensive damage and flooding of the leveed area. Seepage has been reported, in more recent flood events, and seepage remains a risk to the levee system in future flood events.”

Levee Dist. No. 3

No failures of this levee have been reported in the past 25 years.

***Probability of Future Occurrence***

With 2 failures in the past 25 years, the probability of future occurrence equals 8%.

**Vulnerability**

***Vulnerability Overview***

The NLD’s Risk Characteristics for both Levee Dist. No. 2 and No. 3 are rated as Low.

***Potential Losses to Existing Development***

The NLD lists only 3 people and 3 structures at risk to a failure of Levee No. 2, but the property value is of the impacted area is nearly \$2 million and crop damage would be significant as seen in the flood assessment of this chapter.

For Levee No. 3, the NLD lists 814 people and 321 structures as risk of a failure. Property value for at-risk development is \$38 million.

***Impact of Future Development***

Little if any new development is expected in the inundation area of Levee No. 2, as this land is currently in agricultural use. Meanwhile, the area protected by Levee No. 3 is downtown Ste. Genevieve, which is already fully developed; therefore, no significant additional development is expected in this area.

---

### ***Hazard Summary by Jurisdiction***

Excluding the two levee districts themselves, the county and city of Ste. Genevieve are the only two jurisdictions threatened by a levee failure. The levee protecting the city has not had any failures, though if the levee were to fail significant property damage would occur. The levee protecting the county has experience two failures in the past 25 years, resulting in significant crop damage.

### **Problem Statement**

Levee failure is a constant concern for the levee districts, the county, and the city of Ste. Genevieve. While the levee protecting the city has not experienced a failure, such an event would be potentially catastrophic to the city's economy. Given past failures, the possible failure of levee No. 2 looms over the county any time the river rises above flood stage. While few structures and residents are threatened by a levee failure in this area, economic impacts on agricultural production are significant.

---

## 3.4.9 Thunderstorm/High Winds/Lightning/Hail

---

### **Hazard Profile**

#### ***Hazard Description***

##### **Thunderstorms**

A thunderstorm is defined as a storm that contains lightning and thunder which is caused by unstable atmospheric conditions. When cold upper air sinks and warm moist air rises, storm clouds or 'thunderheads' develop resulting in thunderstorms. This can occur singularly, as well as in clusters or lines. The National Weather Service defines a thunderstorm as "severe" if it includes hail that is one inch or more, or wind gusts that are at 58 miles per hour or higher. At any given moment across the world, there are about 1,800 thunderstorms occurring. Severe thunderstorms most often occur in Missouri in the spring and summer, during the afternoon and evenings, but can occur at any time. Other hazards associated with thunderstorms are heavy rains resulting in flooding and tornadoes (discussed separately).

##### **High Winds**

A severe thunderstorm can produce winds causing as much damage as a weak tornado. The damaging winds of thunderstorms include downbursts, microbursts, and straight-line winds. Downbursts are localized currents of air blasting down from a thunderstorm, which induce an outward burst of damaging wind on or near the ground. Microbursts are minimized downbursts covering an area of less than 2.5 miles across. They include a strong wind shear (a rapid change in the direction of wind over a short distance) near the surface. Microbursts may or may not include precipitation and can produce winds at speeds of more than 150 miles per hour. Damaging straight-line winds are high winds across a wide area that can reach speeds of 140 miles per hour.

##### **Lightning**

All thunderstorms produce lightning which can strike outside of the area where it is raining and has been known to strike more than 10 miles away from the rainfall area. Thunder is simply the sound that lightning makes. Lightning is a huge discharge of electricity that shoots through the air causing vibrations and creating the sound of thunder.

##### **Hail**

According to the National Oceanic and Atmospheric Administration (NOAA), hail is precipitation that is formed when thunderstorm updrafts carry raindrops upward into extremely cold atmosphere causing them to freeze. The raindrops form into small frozen droplets. They continue to grow as they come into contact with super-cooled water which will freeze on contact with the frozen rain droplet. This frozen droplet can continue to grow and form hail. As long as the updraft forces can support or suspend the weight of the hailstone, hail can continue to grow before it hits the earth.

At the time when the updraft can no longer support the hailstone, it will fall down to the earth. For example, a ¼" diameter or pea sized hail requires updrafts of 24 miles per hour, while a 2 ¾" diameter or baseball sized hail requires an updraft of 81 miles per hour. According to the NOAA, the largest hailstone in diameter recorded in the United States was found in Vivian, South Dakota on July 23, 2010. It was eight inches in diameter, almost the size of a soccer ball. Soccer-ball-sized hail is the exception, but even small pea-sized hail can do damage.

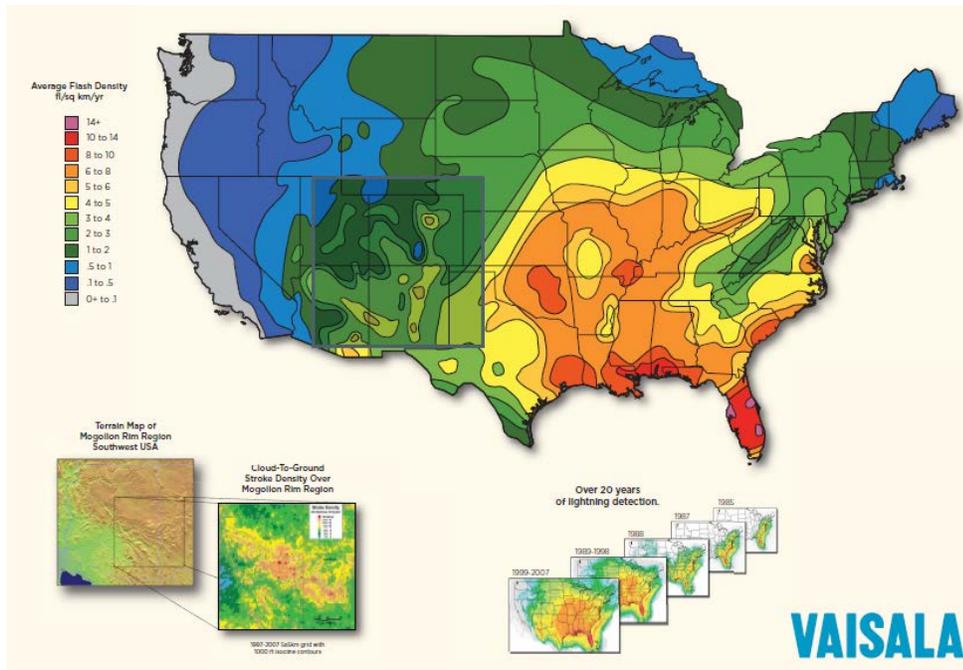

#### ***Geographic Location***

Thunderstorms/high winds/hail/lightning events are an area-wide hazard that can happen anywhere in the county. Although these events occur similarly throughout the planning area, they are more frequently

reported in more urbanized areas. In addition, damages are more likely to occur in more densely developed urban areas.

Figure 3.15 shows lightning frequency in the state, with the County located in the 6 to 8 category.

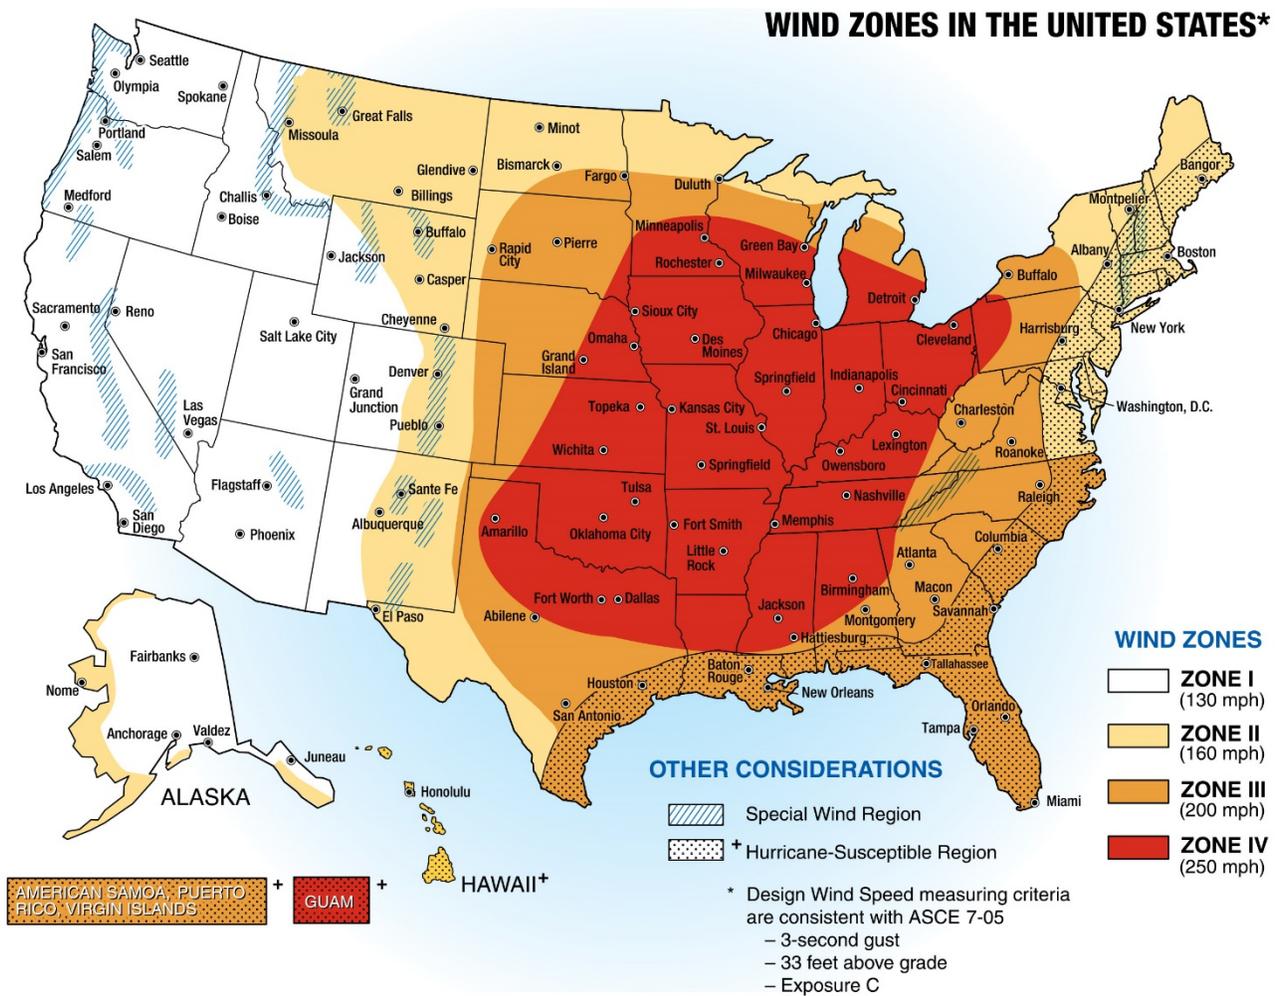

**Figure 3.15. Location and Frequency of Lightning in Missouri**

Source: National Weather Service, [http://www.lightningsafety.noaa.gov/stats/08\\_Vaisala\\_NLDN\\_Poster.pdf](http://www.lightningsafety.noaa.gov/stats/08_Vaisala_NLDN_Poster.pdf). Note: indicate location of planning area with a colored square or arrow.

Figure 3.16 shows the wind zones in the nation, with the county located in Zone 4.

**Figure 3.16. Wind Zones in the United States**

Source: FEMA 320, Taking Shelter from the Storm, 3rd edition, [http://www.weather.gov/media/bis/FEMA\\_SafeRoom.pdf](http://www.weather.gov/media/bis/FEMA_SafeRoom.pdf)

**Severity/Magnitude/Extent**

Severe thunderstorm losses are usually attributed to the associated hazards of hail, downburst winds, lightning and heavy rains. Losses due to hail and high wind are typically insured losses that are localized and do not result in presidential disaster declarations. However, in some cases, impacts are severe and widespread and assistance outside state capabilities is necessary. Hail and wind also can have devastating impacts on crops. Severe thunderstorms/heavy rains that lead to flooding are discussed in the flooding hazard profile. Hailstorms cause damage to property, crops, and the environment, and can injure and even kill livestock. In the United States, hail causes more than \$1 billion in damage to property and crops each year. Even relatively small hail can shred plants to ribbons in a matter of minutes. Vehicles, roofs of buildings and homes, and landscaping are also commonly damaged by hail. Hail has been known to cause injury to humans, occasionally fatal injury.

In general, assets in the County vulnerable to thunderstorms with lightning, high winds, and hail include people, crops, vehicles, and built structures. Although this hazard results in high annual losses, private property insurance and crop insurance usually cover the majority of losses. Considering insurance coverage as a recovery capability, the overall impact on jurisdictions is reduced.

Most lightning damages occur to electronic equipment located inside buildings. But structural damage can

also occur when a lightning strike causes a building fire. In addition, lightning strikes can cause damages to crops if fields or forested lands are set on fire. Communications equipment and warning transmitters and receivers can also be knocked out by lightning strikes.

[http://www.lightningsafety.noaa.gov/stats/08\\_Vaisala\\_NLDN\\_Poster.pdf](http://www.lightningsafety.noaa.gov/stats/08_Vaisala_NLDN_Poster.pdf) and <http://www.lightningsafety.noaa.gov/>

Based on information provided by the Tornado and Storm Research Organization (TORRO), **Table 3.22** below describes typical damage impacts of the various sizes of hail.

**Table 3.22. Tornado and Storm Research Organization Hailstorm Intensity Scale**

Intensity Category	Diameter (mm)	Diameter (inches)	Description	Size	Typical Damage Impacts
Hard Hail	5-9	0.2-0.4	Pea		No damage
Potentially Damaging	10-15	0.4-0.6	Mothball		Slight general damage to plants, crops
Significant	16-20	0.6-0.8	Marble, grape		Significant damage to fruit, crops, vegetation
Severe	21-30	0.8-1.2	Walnut		Severe damage to fruit and crops, damage to glass and plastic structures, paint and wood scored
Severe	31-40	1.2-1.6	Pigeon's egg > squash ball		Widespread glass damage, vehicle bodywork damage
Destructive	41-50	1.6-2.0	Golf ball > Pullet's egg		Wholesale destruction of glass, damage to tiled roofs, significant risk of injuries
Destructive	51-60	2.0-2.4	Hen's egg		Bodywork of grounded aircraft dented, brick walls pitted
Destructive	61-75	2.4-3.0	Tennis ball > cricket ball		Severe roof damage, risk of serious injuries
Destructive	76-90	3.0-3.5	Large orange > Soft ball		Severe damage to aircraft bodywork
Super Hailstorms	91-100	3.6-3.9	Grapefruit		Extensive structural damage. Risk of severe or even fatal injuries to persons caught in the open
Super Hailstorms	>100	4.0+	Melon		Extensive structural damage. Risk of severe or even fatal injuries to persons caught in the open

Source: Tornado and Storm Research Organization (TORRO), Department of Geography, Oxford Brookes University

Notes: In addition to hail diameter, factors including number and density of hailstones, hail fall speed and surface wind speeds affect severity. <http://www.torro.org.uk/site/hscale.php>

Straight-line winds are defined as any thunderstorm wind that is not associated with rotation (i.e., is not a tornado). It is these winds, which can exceed 100 miles per hour, which represent the most common type of severe weather. They are responsible for most wind damage related to thunderstorms. Since thunderstorms do not have narrow tracks like tornadoes, the associated wind damage can be extensive and affect entire (and multiple) counties. Objects like trees, barns, outbuildings, high-profile vehicles, and power lines/poles can be toppled or destroyed, and roofs, windows, and homes can be damaged as wind speeds increase.

The onset of thunderstorms with lightning, high wind, and hail is generally rapid. Duration is less than six hours and warning time is generally six to twelve hours. Nationwide, lightning kills 75 to 100 people each year. Lightning strikes can also start structural and wildland fires, as well as damage electrical systems and equipment.

**Previous Occurrences**

Table 3.23, Table 3.24, and Table 3.25 show the previous occurrences of high wind events, lightning events, and hail events in the County. All data is from the NCEI.

Limitations to the use of NCEI reported lightning events include the fact that only lightning events that result

in fatality, injury and/or property and crop damage are in the NCEI.

**Table 3.23. High & Strong Wind Events 1994-2019**

**Probability of Future Occurrence**

Only 4 events of high or strong winds in past 25 years are listed in the NCEI, leading to a probability of 16%. While only 5 lighting events are listed in the NCEI, data limitations are the leading factor in this phenomenon, not the lack of actual events. The HMPC believes it is safe to assume that at least one lightning strike will occur each year in the County.

NCEI lists 17 events of hail of 1” or greater in the past 25 years, which equals a probability of 68%. Additionally, NOAA’s NSSL indicates hail of 2” diameter or more is likely to occur 1 day every 16 months in the County (see Figure 3.17)

**Figure 3.17. Annual Hailstorm Probability (2” diameter or larger), U 1980- 1994**

Source: NSSL, [http://www.nssl.noaa.gov/users/brooks/public\\_html/bighail.gif](http://www.nssl.noaa.gov/users/brooks/public_html/bighail.gif) Note:

**Vulnerability**

**Vulnerability Overview**

Based on the state’s 2018 HMP, Ste. Genevieve County has a summarized thunderstorm vulnerability rating of “Low.”

**Potential Losses to Existing Development**

Available data indicates only small losses due to any element of a severe thunderstorm, though anecdotal evidence exists indicating that roof and vehicle damage do often result during very strong thunderstorms.

**Future Development**

Additional development will result in the exposure of more structures to damages from severe thunderstorms.

---

### ***Hazard Summary by Jurisdiction***

Ste. Genevieve is the most exposed jurisdiction simply due to the higher density of development, followed by Bloomsdale, St. Mary, and the county. Other than the population density difference, all jurisdictions are equally at risk to such hazard events.

### **Problem Statement**

Impacts from these events are typically property related, with debris, falling trees, and hail damage. Advanced warnings typically keep residents inside during such events which limits potential injuries and loss of life. While all jurisdictions can be impacted by these events, the cities and county are most affected due to their size compared to the relatively small campuses of the school districts. Of the cities and the county, the cities are the most affected due to the density of development and concentration of higher property values.

---

## 3.4.10 Tornado

---

### **HazardProfile**

#### ***Hazard Description***

The NWS defines a tornado as “a violently rotating column of air extending from a thunderstorm to the ground.” It is usually spawned by a thunderstorm and produced when cool air overrides a layer of warm air, forcing the warm air to rise rapidly. Often, vortices remain suspended in the atmosphere as funnel clouds. When the lower tip of a vortex touches the ground, it becomes a tornado.

High winds not associated with tornadoes are profiled separately in this document in Section 3.4.9, Thunderstorm/High Wind/Hail/Lightning.

Essentially, tornadoes are a vortex storm with two components of winds. The first is the rotational winds that can measure up to 500 miles per hour, and the second is an uplifting current of great strength. The dynamic strength of both these currents can cause vacuums that can overpressure structures from the inside.

Although tornadoes have been documented in all 50 states, most of them occur in the central United States due to its unique geography and presence of the jet stream. The jet stream is a high-velocity stream of air that separates the cold air of the north from the warm air of the south. During the winter, the jet stream flows west to east from Texas to the Carolina coast. As the sun moves north, so does the jet stream, which at summer solstice flows from Canada across Lake Superior to Maine. During its move northward in the spring and its recession south during the fall, the jet stream crosses Missouri, causing the large thunderstorms that breed tornadoes.

A typical tornado can be described as a funnel-shaped cloud in contact with the earth’s surface that is “anchored” to a cloud, usually a cumulonimbus. This contact on average lasts 30 minutes and covers an average distance of 15 miles. The width of the tornado (and its path of destruction) is usually about 300 yards. However, tornadoes can stay on the ground for upward of 300 miles and can be up to a mile wide. The National Weather Service, in reviewing tornadoes occurring in Missouri between 1950 and 1996, calculated the mean path length at 2.27 miles and the mean path area at 0.14 square mile.

The average forward speed of a tornado is 30 miles per hour but may vary from nearly stationary to 70 miles per hour. The average tornado moves from southwest to northeast, but tornadoes have been known to move in any direction. Tornadoes are most likely to occur in the afternoon and evening, but have been known to occur at all hours of the day and night.

#### ***Geographic Location***

Tornadoes can occur at any location in the planning area with equal probability.

#### ***Severity/Magnitude/Extent***

Tornadoes are the most violent of all atmospheric storms and are capable of tremendous destruction. Wind speeds can exceed 250 miles per hour and damage paths can be more than one mile wide and 50 miles long. Tornadoes have been known to lift and move objects weighing more than 300 tons a distance of 30 feet, toss homes more than 300 feet from their foundations, and siphon millions of tons of water from water bodies. Tornadoes also can generate a tremendous amount of flying debris or “missiles,” which often become airborne shrapnel that causes additional damage. If wind speeds are high enough, missiles can be thrown at a building with enough force to penetrate windows, roofs, and walls. However, the less spectacular damage is much more common.

Tornado magnitude is classified according to the EF- Scale (or the Enhance Fujita Scale, based on the original Fujita Scale developed by Dr. Theodore Fujita, a renowned severe storm researcher). The EF- Scale (see **Table 3.26**) attempts to rank tornadoes according to wind speed based on the damage caused. This update to the original F Scale was implemented in the U.S. on February 1, 2007.

**Table 3.26. Enhanced F Scale for Tornado Damage**

FUJITA SCALE			DERIVED EF SCALE		OPERATIONAL EF SCALE	
F Number	Fastest ¼-mile (mph)	3 Second Gust (mph)	EF Num	3 Second Gust (mph)	EF Number	3 Second Gust (mph)
0	40-72	45-78	0	65-85	0	65-85
1	73-112	79-117	1	86-109	1	86-110
2	113-157	118-161	2	110-137	2	111-135
3	158-207	162-209	3	138-167	3	136-165
4	208-260	210-261	4	168-199	4	166-200
5	261-318	262-317	5	200-234	5	Over 200

Source: The National Weather Service, [www.spc.noaa.gov/faq/tornado/ef-scale.html](http://www.spc.noaa.gov/faq/tornado/ef-scale.html)

The wind speeds for the EF scale and damage descriptions are based on information on the NOAA Storm Prediction Center as listed in **Table 3.27**. The damage descriptions are summaries. For the actual EF scale it is necessary to look up the damage indicator (type of structure damaged) and refer to the degrees of damage associated with that indicator. Information on the Enhanced Fujita Scale’s damage indicators and degrees of damage is located online at [www.spc.noaa.gov/efscale/ef-scale.html](http://www.spc.noaa.gov/efscale/ef-scale.html).

**Table 3.27. Enhanced Fujita Scale with Potential Damage**

Enhanced Fujita Scale			
Scale	Wind Speed (mph)	Relative Frequency	Potential Damage
EF0	65-85	53.5%	Light. Peels surface off some roofs; some damage to gutters or siding; branches broken off trees; shallow-rooted trees pushed over. Confirmed tornadoes with no reported damage (i.e. those that remain in open fields) are always rated EF0).
EF1	86-110	31.6%	Moderate. Roofs severely stripped; mobile homes overturned or badly damaged; loss of exterior doors; windows and other glass broken.
EF2	111-135	10.7%	Considerable. Roofs torn off well-constructed houses; foundations of frame homes shifted; mobile homes complete destroyed; large trees snapped or uprooted; light object missiles generated; cars lifted off ground.
EF3	136-165	3.4%	Severe. Entire stores of well-constructed houses destroyed; severe damage to large buildings such as shopping malls; trains overturned; trees debarked; heavy cars lifted off the ground and thrown; structures with weak foundations blown away some distance.
EF4	166-200	0.7%	Devastating. Well-constructed houses and whole frame houses completely levelled; cars thrown and small missiles generated.
EF5	>200	<0.1%	Explosive. Strong frame houses levelled off foundations and swept away; automobile-sized missiles fly through the air in excess of 300 ft.; steel reinforced concrete structure badly damaged; high rise buildings have significant structural deformation; incredible phenomena will occur.

Source: NOAA Storm Prediction Center, <http://www.spc.noaa.gov/efscale/ef-scale.html>

Enhanced weather forecasting has provided the ability to predict severe weather likely to produce tornadoes days in advance. Tornado watches can be delivered to those in the path of these storms several hours in

advance. Lead time for actual tornado warnings is about 30 minutes. Tornadoes have been known to change paths very rapidly, thus limiting the time in which to take shelter. Tornadoes may not be visible on the ground if they occur after sundown or due to blowing dust or driving rain and hail.

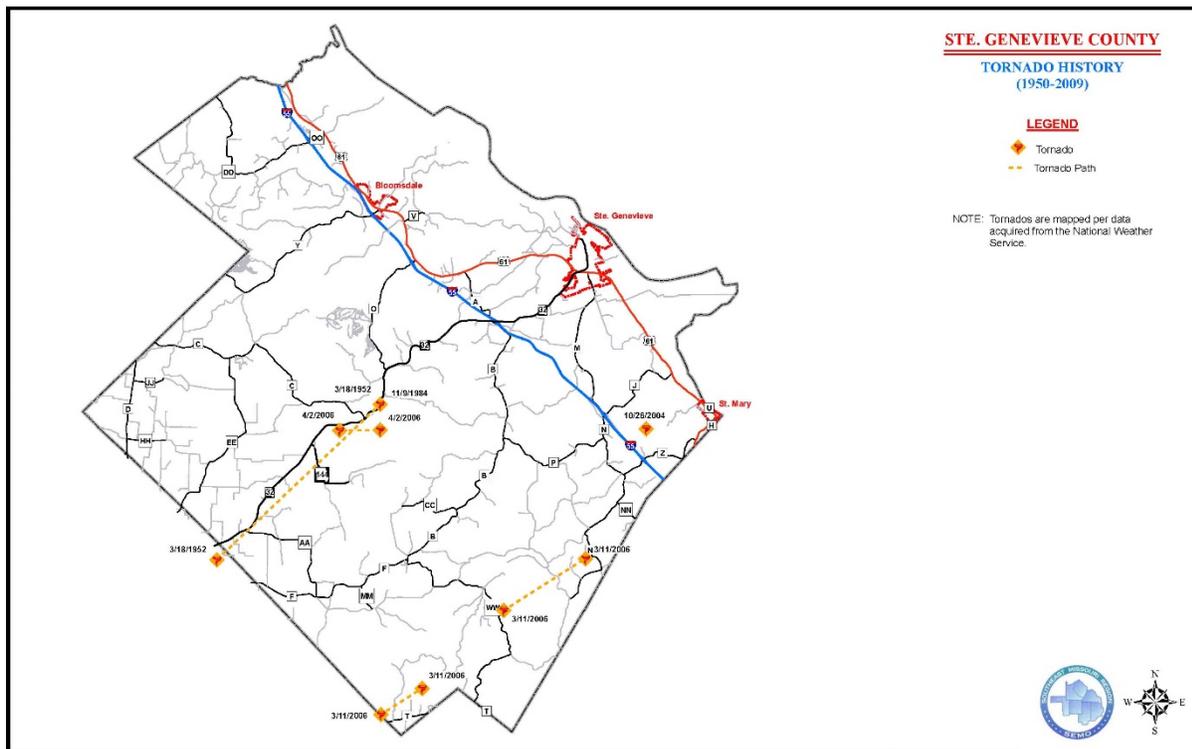

### Previous Occurrences

The NCEI lists 7 tornadoes in the county from 1994-2019. Prior to 1993, only very destructive tornadoes were recorded. It is necessary to go back as far as possible due to the random and intermittent nature of tornado events, but data limitations hinder this.

There are additional limitations to the use of NCEI tornado data that must be noted. For example, one tornado may contain multiple segments as it moves geographically. A tornado that crosses a county line or state line is considered a separate segment for the purposes of reporting to the NCEI. Also, a tornado that lifts off the ground for less than 5 minutes or 2.5 miles is considered a separate segment. If the tornado lifts off the ground for greater than 5 minutes or 2.5 miles, it is considered a separate tornado. Tornadoes reported in Storm Data and the Storm Events Database are in segments.

Figure 3.18 shows the approximate paths of all NCEI listed tornadoes in the County from 1950 to present.

**Figure 3.18. Historic Tornado Events**

Source: National Climatic Data Center, <http://www.NCEI.noaa.gov/stormevents/>

### Probability of Future Occurrence

There have been 7 NCEI listed tornadoes in the County over the past 25 years. This equals an annual probability of 28% of a tornado event.

---

## **Vulnerability**

### ***Vulnerability Overview***

Ste. Genevieve County is located in the region of the country known as “Tornado Alley,” a region of the nation with a high frequency of dangerous and destructive tornadoes (Figure 3.19). This high frequency leads to an elevated vulnerability to tornadoes for the County, but the rural nature of the County limits the amount of damage done by any single event. Because of this, the 2018 State HMP rates the county with a “Low” tornado vulnerability.

---

**Figure 3.19. Tornado Alley in the U.S.**

Source: <http://www.tornadochaser.net/tornalley.html>

### ***Potential Losses to Existing Development***

According to the 2018 State HMP, Ste. Genevieve County has annualized tornado damages of \$4,590.

### ***Future Development***

Additional development in any jurisdiction will lead to greater exposure of structures to a tornado event. Given the low growth projection of the County though, increases are expected to be minimal.

### ***Hazard Summary by Jurisdiction***

A tornado event is equally likely to happen in any area of the County. With their higher density development though, the communities of Ste. Genevieve, Bloomsdale, and St. Mary are the most exposed jurisdictions.

### **Problem Statement**

Any participant can be affected by a tornado. While the cities are the most exposed due to population and development density, the school district is also densely populated during session. The cities and county have early warning sirens to alert residents to approaching tornadoes. Given the low population density in the county, saferooms are not typically cost effective, unless developed on a county property in one of the communities.

---

### 3.4.11 Winter Weather/Snow/Ice/Severe Cold

---

#### **Hazard Profile**

##### ***Hazard Description***

A major winter storm can last for several days and be accompanied by high winds, freezing rain or sleet, heavy snowfall, and cold temperatures. The National Weather Service describes different types of winter storm events as follows.

**Blizzard**—Winds of 35 miles per hour or more with snow and blowing snow reducing visibility to less than ¼ mile for at least three hours.

**Blowing Snow**—Wind-driven snow that reduces visibility. Blowing snow may be falling snow and/or snow on the ground picked up by the wind.

**Snow Squalls**—Brief, intense snow showers accompanied by strong, gusty winds. Accumulation may be significant.

**Snow Showers**—Snow falling at varying intensities for brief periods of time. Some accumulation is possible.

**Freezing Rain**—Measurable rain that falls onto a surface with a temperature below freezing. This causes it to freeze to surfaces, such as trees, cars, and roads, forming a coating or glaze of ice. Most freezing-rain events are short lived and occur near sunrise between the months of December and March.

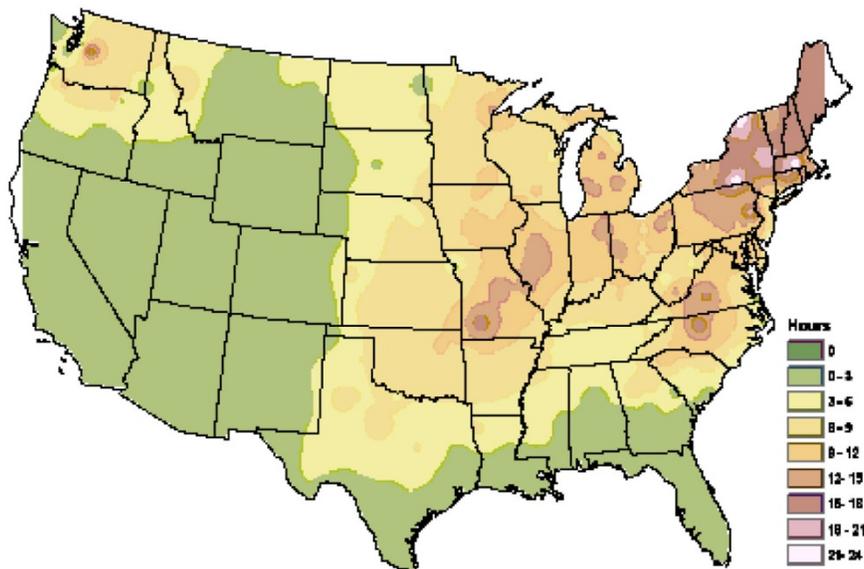

**Sleet**—Rain drops that freeze into ice pellets before reaching the ground. Sleet usually bounces when hitting a surface and does not stick to objects.

##### ***Geographic Location***

The entire county is vulnerable to heavy snow, ice, freezing rain, and extreme cold temperatures. Figure 3.20 shows the average number of hours per year with freezing rain, with the County sitting on the line between 9-12 hours and 12-15 hours.

---

**Figure 3.20. NWS Statewide Average Number of Hours per Year with Freezing Rain**

Source: American Meteorological Society. "Freezing Rain Events in the United States." <http://ams.confex.com/ams/pdfpapers/71872.pdf>

##### ***Severity/Magnitude/Extent***

Severe winter storms include extreme cold, heavy snowfall, ice, and strong winds which can push the wind chill well below zero degrees in the planning area. Heavy snow can bring a community to a standstill by inhibiting transportation (in whiteout conditions), weighing down utility lines, and by causing structural collapse in

---

buildings not designed to withstand the weight of the snow. Repair and snow removal costs can be significant. Ice buildup can collapse utility lines and communication towers, as well as make transportation difficult and hazardous. Ice can also become a problem on roadways if the air temperature is high enough that precipitation falls as freezing rain rather than snow.

Extreme cold often accompanies severe winter storms and can lead to hypothermia and frostbite in people without adequate clothing protection. Cold can cause fuel to congeal in storage tanks and supply lines, stopping electric generators. Cold temperatures can also overpower a building's heating system and cause water and sewer pipes to freeze and rupture. Extreme cold also increases the likelihood for ice jams on flat rivers or streams. When combined with high winds from winter storms, extreme cold becomes extreme wind chill, which is hazardous to health and safety.

The National Institute on Aging estimates that more than 2.5 million Americans are elderly and especially vulnerable to hypothermia, with the isolated elders being most at risk. About 10 percent of people over the age of 65 have some kind of bodily temperature-regulating defect, and 3-4 percent of all hospital patients over 65 are hypothermic.

Also at risk are those without shelter, those who are stranded, or who live in a home that is poorly insulated or without heat. Other impacts of extreme cold include asphyxiation (unconsciousness or death from a lack of oxygen) from toxic fumes from emergency heaters; household fires, which can be caused by fireplaces and emergency heaters; and frozen/burst pipes.

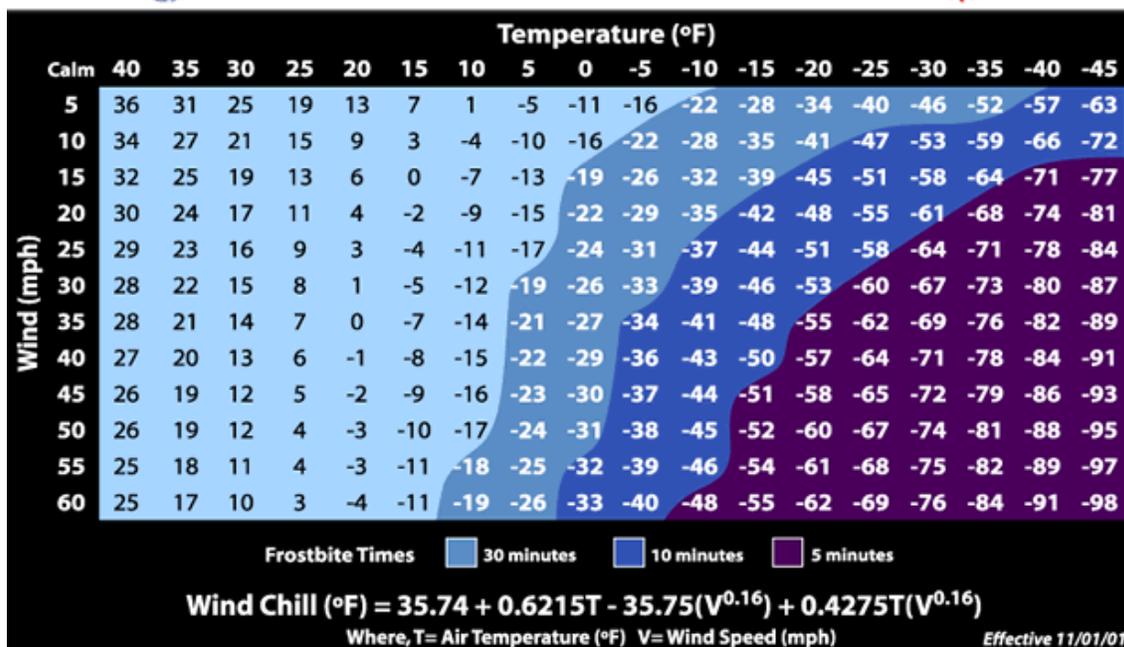

Buildings with overhanging tree limbs are more vulnerable to damage during winter storms when limbs fall. Businesses experience loss of income as a result of closure during power outages. In general heavy winter storms increase wear and tear on roadways though the cost of such damages is difficult to determine. Businesses can experience loss of income as a result of closure during winter storms.

Overhead power lines and infrastructure are also vulnerable to damages from winter storms. In particular ice accumulation during winter storm events damage to power lines due to the ice weight on the lines and equipment. Damages also occur to lines and equipment from falling trees and tree limbs weighted down by ice. Potential losses could include cost of repair or replacement of damaged facilities, and lost economic opportunities for businesses.

Secondary effects from loss of power could include burst water pipes in homes without electricity during winter storms. Public safety hazards include risk of electrocution from downed power lines. Specific amounts of estimated losses are not available due to the complexity and multiple variables associated with this hazard. Standard values for loss of service for utilities reported in FEMA's 2009 BCA Reference Guide, the economic impact as a result of loss of power is \$126 per person per day of lost service.

Wind can greatly amplify the impact of cold ambient air temperatures. Provided by the National Weather Service, Figure 3.21 below shows the relationship of wind speed to apparent temperature and typical time periods for the onset of frostbite.

Figure 3.21. Wind Chill Chart

Source: National Weather Service, <http://www.nws.noaa.gov/om/winter/windchill.shtml>

**Previous Occurrences**

The National Centers for Environmental Information lists 38 winter weather events in the past 25 years. Table 3.28 provides a list of the events.

Table 3.28. NCEI Winter Weather Events Summary, 1993-2017

Source: NCEI

### ***Probability of Future Occurrence***

With 38 events in 25 years, the County is projected to experience at least one winter storm event every year.

## **Vulnerability**

### ***Vulnerability Overview***

The 2018 State HMP lists the county with a “Low” vulnerability to winter storm events. This determination is made based on multiple factors, including housing density, likelihood of the event, property and crop losses, and social vulnerability.

### ***Potential Losses to Existing Development***

According to the 2018 State HMP, the county has had property annualized losses of \$25,190 per year.

### ***Future Development***

Additional development will increase a jurisdiction’s exposure to the hazard by adding structures and people to the study area. The minor projected growth rate of the county and communities indicates little future impact due to development trends.

### ***Hazard Summary by Jurisdiction***

All jurisdictions are equally exposed to severe winter weather, though the event will have different impacts on

---

different jurisdictions. Schools are typically closed during these events, making property damage their primary concern. While the county has far less population density compared to the communities, county residents can far more easily have transportation and communications severed by winter storms, leaving them isolated for days or even weeks in extreme cases. For the communities, the inverse is true; residents continue to have services and contacts in close proximity, but there are far more people affected by the event.

### **Problem Statement**

Winter weather can affect any of the participants. While the school districts typically close during severe events, in some cases children are present when an event occurs sooner or stronger than expected. Transportation of students during such an event can be dangerous, and power failures are also possible. The density of development in the cities increases its exposure, but residents are also closer to emergency services when compared to county residents. Because of this, each jurisdiction is impacted by these events in a slightly different manner.

## 4 MITIGATION STRATEGY

---

<b>4</b>	<b>MITIGATION STRATEGY .....</b>	<b>4.1</b>
4.1	<i>Goals.....</i>	4.1
4.2	<i>Identification and Analysis of Mitigation Actions.....</i>	4.1
4.3	<i>Implementation of Mitigation Actions .....</i>	4.3

This section presents the mitigation strategy updated by the HMPC based on the updated risk assessment. The mitigation strategy was developed through a collaborative group process. The process included review of updated general goal statements to guide the jurisdictions in lessening disaster impacts as well as specific mitigation actions to directly reduce vulnerability to hazards and losses. The following definitions are taken from FEMA’s *Local Hazard Mitigation Review Guide (October 1, 2012)*.

- **Mitigation Goals** are general guidelines that explain what you want to achieve. Goals are long-term policy statements and global visions that support the mitigation strategy. The goals address the risk of hazards identified in the plan.
- **Mitigation Actions** are specific actions, projects, activities, or processes taken to reduce or eliminate long-term risk to people and property from hazards and their impacts. Implementing mitigation actions helps achieve the plan’s mission and goals.

### 4.1 Goals

---

This planning effort is an update to Ste. Genevieve County’s existing hazard mitigation plan approved by FEMA in 2014. Therefore, the goals from the previous HMP were reviewed to see if they were still valid, feasible, practical, and applicable to the defined hazard impacts. The HMPC conducted a discussion session during their second meeting to review and update the plan goals. To ensure that the goals developed for this update were comprehensive and supported State goals, the 2018 State Hazard Mitigation Plan goals were also reviewed. SEMO RPC also presented common goals from other county HMPs.

After discussion, the HMPC decided the 2014 goals were still valid. The goals for this plan update are:

1. Protect the health, safety, and welfare of residents and students.
2. Ensure the operation of critical facilities and services.
3. Protect public and private property.
4. Enhance informed decision making of mitigation actions.

### 4.2 Identification and Analysis of Mitigation Actions

---

During the second MPC meeting, the results of the risk assessment update were provided to the HMPC members for review and the key issues were identified for specific hazards. Changes in risk since adoption of the previously approved plan were discussed. The second meeting concluded with the distribution of a list of possible mitigation actions to prompt discussions within and among the jurisdictions. The discussions occurred during jurisdictional break-out meetings. The list included possible new mitigation actions, as well as actions from the previously approved plan. Actions from the previous plan included completed actions, on-

going actions, and actions upon which progress had not been made. The HMPC discussed SEMA’s identified funding priorities and the types of mitigation actions generally recognized by FEMA.

The HMPC then updated the mitigation strategy of each jurisdiction during Meeting 2 and through electronic correspondence afterward. For a comprehensive range of mitigation actions to consider, the HMPC reviewed the following information:

- A list of actions proposed in the previous mitigation plan, the current State Plan, and approved plans in surrounding counties,
- Key issues from the risk assessments,
- State priorities established for Hazard Mitigation Assistance grants, and
- Public input during meetings, responses to Data Collection Questionnaires, and other efforts to involve the public in the plan development process.

Individual jurisdictions, including school districts, then developed final mitigation strategies for inclusion in the plan. They were encouraged to review the details of the risk assessment vulnerability analysis specific to their jurisdiction. They were also provided a link to the FEMA’s publication, *Mitigation Ideas: A Resource for Reducing Risk to Natural Hazards (January 2013)*. This document was developed by FEMA as a resource for identification of a range of potential mitigation actions for reducing risk to natural hazards and disasters.

The MPC reviewed the actions from the previously approved plan for progress made since the plan had been adopted, using worksheets included in the appendix of this plan. Each jurisdiction was instructed to provide information regarding the “Action Status” with one of the following status choices:

- Completed, with a description of the progress,
- Not Started/Continue in Plan Update, with a discussion of the reasons for lack of progress,
- In Progress/Continue in Plan Update, with a description of the progress made to date or
- Deleted, with a discussion of the reasons for deletion.

Table 4.1 provides a summary of the action statuses for each jurisdiction:

**Table 4.1. Action Status Summary**

Jurisdiction	Completed Actions	Continuing Actions (ongoing or modify)	Deleted Actions
Ste. Genevieve County	0	11	19
Bloomdsdale	0	3	18
St. Mary	0	4	18
Ste. Genevieve	0	7	18
Ste. Genevieve R-II School Dist.	0	4	6
Levee District No. 2	0	2	0
Levee District No. 3	0	2	0

Table 4.2 provides a summary of the completed and deleted actions from the previous plan.

**Table 4.2. Summary of Completed and Deleted Actions from the Previous Plan**

Deleted Actions	Reason for Deletion
Emphasize county planning and zoning and building codes	County has no planning or zoning
Enforce floodplain regulations and boundaries	Included in NFIP actions
Assist in updating of FIRMs	Included in NFIP actions
Require permits for development in a floodplain	Included in NFIP actions
Buyout repetitive loss properties	No potential properties identified at this time
Issue evacuation orders	Not a mitigation action
Regularly inspect, repair, and improve dams	No dams under jurisdictions' control
Encourage mobile home owners to anchor homes	Jurisdictions felt action was weak
Retrofit, where possible, buildings and bridges for seismic resistance	No structures identified at this time
Clear brush and debris from around buildings	On-going maintenance, weak action
Retain green space and reduce hard surface areas	Jurisdictions chose to focus on other actions
Encourage reinforcement of towers	Jurisdictions have no control over towers, weak action
Maintain mutual aid agreements	General practice of jurisdictions, weak action
Monitor weather	General practice of jurisdictions, weak action
Confirm equipment is in usable condition	General practice of jurisdictions, weak action
Provide emergency shelters	Included in Safe Room actions
Maintain GIS system	General practice of jurisdictions, weak action
Make pertinent data available	General practice of jurisdictions, weak action

### 4.3 Implementation of Mitigation Actions

Jurisdictions were encouraged to meet with others in their community to finalize the actions to be submitted for the updated mitigation strategy. Throughout the HMPC consideration and discussion, emphasis was placed on the importance of a benefit-cost analysis in determining project priority. The Disaster Mitigation Act requires benefit-cost review as the primary method by which mitigation projects should be prioritized. The HMPC decided to pursue implementation according to when and where damage occurs, available funding, political will, and jurisdictional priority. The benefit/cost review at the planning stage primarily consisted of a qualitative analysis, and was not the detailed process required for grant funding applications. For each action, the plan sets forth a narrative describing the types of benefits that could be realized from action implementation. The cost was estimated as closely as possible, with further refinement to be supplied as project development occurs.

FEMA's STAPLEE methodology was used to assess the costs and benefits, overall feasibility of mitigation actions, and other issues impacting project. During the prioritization process, the HMPC used worksheets to assign scores. The worksheets posed questions based on the STAPLEE elements as well as the potential mitigation effectiveness of each action. Scores were based on the responses to the questions as follows:

- Definitely yes = 3 points
- Maybe yes = 2 points
- Probably no = 1
- Definitely no = 0

The following questions were asked for each proposed action.

S: Is the action socially acceptable?

T: Is the action technically feasible and potentially successful?

A: Does the jurisdiction have the administrative capability to successfully implement this action?

P: Is the action politically acceptable?

L: Does the jurisdiction have the legal authority to implement the action?

E: Is the action economically beneficial?

E: Will the project have an environmental impact that is either beneficial or neutral? (score "3" if positive and "2" if neutral)

Will the implemented action result in lives saved?

Will the implanted action result in a reduction of disaster damage?

A blank STAPLEE worksheet is shown in Figure 4.1

Figure 4.1. Blank STAPLEE Worksheet

# 5 PLAN MAINTENANCE PROCESS

---

<b>5 PLAN MAINTENANCE PROCESS .....</b>	<b>5.1</b>
<i>5.1 Monitoring, Evaluating, and Updating the Plan.....</i>	<i>5.1</i>
5.1.1 Responsibility for Plan Maintenance .....	5.1
5.1.2 Plan Maintenance Schedule .....	5.1
5.1.3 Plan Maintenance Process.....	5.1
5.2 Incorporation into Existing Planning Mechanisms .....	5.2
5.3 Continued Public Involvement.....	5.5

This chapter provides an overview of the overall strategy for plan maintenance and outlines the method and schedule for monitoring, updating and evaluating the plan. The chapter also discusses incorporating the plan into existing planning mechanisms and how to address continued public involvement.

## **5.1 Monitoring, Evaluating, and Updating the Plan**

---

### **5.1.1 Responsibility for Plan Maintenance**

The MPC is an advisory body and can only make recommendations to county, city, town, or district elected officials. Its primary duty is to see the plan successfully carried out and to report to the community governing boards and the public on the status of plan implementation and mitigation opportunities. Other duties include reviewing and promoting mitigation proposals, hearing stakeholder concerns about hazard mitigation, passing concerns on to appropriate entities, and posting relevant information in areas accessible to the public.

### **5.1.2 Plan Maintenance Schedule**

The MPC agrees to meet annually and after a state or federally declared hazard event as appropriate to monitor progress and update the mitigation strategy. The county Emergency Management Director will be responsible for initiating the plan reviews and will invite members of the MPC to the meeting.

In coordination with all participating jurisdictions, a five-year written update of the plan will be submitted to the Missouri State Emergency Management Agency (SEMA) and FEMA Region VII per Requirement §201.6(c)(4)(i) of the Disaster Mitigation Act of 2000, unless disaster or other circumstances (e.g., changing regulations) require a change to this schedule. The Southeast Missouri Regional Planning Commission and the County Emergency Management Director will initiate the five-year update.

### **5.1.3 Plan Maintenance Process**

Progress on the proposed actions can be monitored by evaluating changes in vulnerabilities identified in the plan. The MPC, during the annual meeting, should review changes in vulnerability identified as follows:

- Decreased vulnerability as a result of implementing recommended actions,
- Increased vulnerability as a result of failed or ineffective mitigation actions,

- Increased vulnerability due to hazard events, and/or
- Increased vulnerability as a result of new development (and/or annexation).

Future 5-year updates to this plan will include the following activities:

- Consideration of changes in vulnerability due to action implementation,
- Documentation of success stories where mitigation efforts have proven effective,
- Documentation of unsuccessful mitigation actions and why the actions were not effective,
- Documentation of previously overlooked hazard events that may have occurred since the previous plan approval,
- Incorporation of new data or studies with information on hazard risks,
- Incorporation of new capabilities or changes in capabilities,
- Incorporation of growth data and changes to inventories, and
- Incorporation of ideas for new actions and changes in action prioritization.

In order to best evaluate any changes in vulnerability as a result of plan implementation, the participating jurisdictions will adopt the following process:

- Each proposed action in the plan identified an individual, office, or agency responsible for action implementation. This entity will track and report on an annual basis to the jurisdictional MPC member on action status. The entity will provide input on whether the action as implemented meets the defined objectives and is likely to be successful in reducing risk.
- If the action does not meet identified objectives, the jurisdictional MPC member will determine necessary remedial action, making any required modifications to the plan.

Changes will be made to the plan to remedy actions that have failed or are not considered feasible. Feasibility will be determined after a review of action consistency with established criteria, time frame, community priorities, and/or funding resources. Actions that were not ranked high but were identified as potential mitigation activities will be reviewed as well during the monitoring of this plan. Updating of the plan will be accomplished by written changes and submissions, as the MPC deems appropriate and necessary. Changes will be approved by the governing boards of the participating jurisdictions.

## **5.2 Incorporation into Existing Planning Mechanisms**

---

Where possible, plan participants, including school districts, will use existing plans and/or programs to implement hazard mitigation actions. Based on the capability assessments of the participating jurisdictions, communities in the county will continue to plan and implement programs to reduce losses to life and property from hazards. This plan builds upon the momentum developed through previous and related planning efforts and mitigation programs and recommends implementing actions, where possible, through the following plans:

- General or master plans of participating jurisdictions;
- Ordinances of participating jurisdictions;
- County Emergency Operations Plan;
- Capital improvement plans and budgets;
- Other community plans within the County, such as water conservation plans, storm water management plans, and parks and recreation plans;

- School District plans and budgets; and
- Other plans and policies outlined in the capability assessment sections for each jurisdiction in Chapter 2 of this plan.

The MPC members involved in updating these existing planning mechanisms will be responsible for integrating the findings and actions of the mitigation plan, as appropriate. The MPC is also responsible for monitoring this integration and incorporation of the appropriate information into the five-year update of the multi-jurisdictional hazard mitigation plan.

Additionally, after the annual review of the Hazard Mitigation Plan, the Emergency Management Director will provide the updated Mitigation Strategy with current status of each mitigation action to the County Commission as well as all Mayors, City Clerks, and School District Superintendents. The Emergency Manager Director will request that the mitigation strategy be incorporated, where appropriate, in other planning mechanisms.

**Table 5.1** below lists the planning mechanisms by jurisdiction into which the Hazard Mitigation Plan will be integrated.

**Table 5.1. Planning Mechanisms Identified for Integration of Hazard Mitigation Plan**

Jurisdiction	Planning Mechanisms	Integration Process for Previous Plan	Integration Process for Current Plan
Ste. Genevieve County	County Emergency Operations Plan	County officials identified actions relating to emergency operations that were included in the update to the EOP	County officials identified new or ongoing actions relating to emergency operations that will be included in the next update to the EOP
Bloomdsdale	Annual Budget Review & Development	City officials identified actions that were discussed during annual budget process	City officials identified new or ongoing actions that will be discussed during the next annual budget process
St. Mary	Comprehensive Plan	Plan was not updated since previous HMP process	City officials identified new or ongoing actions relating to future development that will be included in the next Comprehensive Plan update
St. Mary	Emergency Operations Plan	City officials identified actions relating to emergency operations that were included in the update to the EOP	City officials identified new or ongoing actions relating to emergency operations that will be included in the next update to the EOP
Ste. Genevieve	Comprehensive Plan	Plan was not updated since previous HMP process	City officials identified new or ongoing actions relating to future

			development that will be included in the next Comprehensive Plan update
Ste. Genevieve	Capital Improvement Plan	Plan was not updated since previous HMP process	City officials identified new or ongoing actions relating to future development that will be included in the next CIP update
Ste. Genevieve	Land Use Plan	Plan was not updated since previous HMP process	City officials identified new or ongoing actions relating to future development that will be included in the next Land Use Plan update
Ste. Genevieve	Transportation Plan	Plan was not updated since previous HMP process	City officials identified new or ongoing actions relating to future development that will be included in the next Transportation Plan update
Ste. Genevieve R-II School Dist.	Master Plan	Plan was not updated since previous HMP process	School representatives identified new or ongoing actions relating to future development that will be included in the next Master Plan update
Ste. Genevieve R-II School Dist.	Capital Improvement Program	School representatives identified actions relating to infrastructure that were included in annual update to CIP	School representatives identified new actions or ongoing actions relating to infrastructure that will be included in annual update to CIP
Ste. Genevieve R-II School Dist.	School Emergency Plan	School representatives identified actions relating to emergency procedures that were included in previous update to Emergency Plan	School representatives identified new actions or ongoing actions relating to emergency procedures that will be included in the next update to the Emergency Plan
Levee Dist. No. 2	Capital Improvement Plan	Plan was not updated since previous HMP process	District representatives identified new or ongoing actions relating to infrastructure that will be included in the

			next CIP update
Levee Dist. No. 3	Annual Budget Review & Development	District representatives identified actions that were discussed during annual budget process	District representatives identified new or ongoing actions that will be discussed during the next annual budget process

### 5.3 Continued Public Involvement

---

The hazard mitigation plan update process provides an opportunity to publicize success stories resulting from the plan’s implementation and seek additional public comment. Information about the annual reviews will be posted in the local newspaper as well as on the county website following each annual review of the mitigation plan. When the MPC reconvenes for the five-year update, it will coordinate with all stakeholders participating in the planning process. Included in this group will be those who joined the MPC after the initial effort, to update and revise the plan. Public notice will be posted and public participation will be actively solicited, at a minimum, through available website postings and press releases to local media outlets, primarily newspapers.

The following Resolution was Adopted by Ste. Genevieve County on October 31, 2019.

### RESOLUTION NO. 10312019

**A RESOLUTION OF ADOPTION OF THE NATURAL HAZARD MITIGATION PLAN (as Updated in 2019) AS BEING ADOPTED BY THE COUNTY OF STE. GENEVIEVE. SAID PLAN IS AN ALL-HAZARD MITIGATION PLAN TO WORK TOWARD BECOMING A SAFER COMMUNITY.**

**WHEREAS**, Ste. Genevieve County recognizes the threat that natural hazards pose to people and property within the County of Ste. Genevieve; and

**WHEREAS**, Ste. Genevieve County has participated in the preparation of a multi-hazard mitigation plan, hereby known as the *STE. GENEVIEVE COUNTY ALL-HAZARD MITIGATION PLAN AS UPDATED IN 2019*, hereafter referred to as the *PLAN*, in accordance with the Disaster Mitigation Act of 2000; and

**WHEREAS**, the *PLAN* identifies mitigation goals and actions to reduce or eliminate long-term risk to people and property in the County of Ste. Genevieve from the impacts of future hazards and disasters; and

**WHEREAS**, Ste. Genevieve County recognizes that land use policies have a major impact on whether people and property are exposed to natural hazards, the County of Ste. Genevieve will endeavor to integrate the *PLAN* into the comprehensive planning process; and

**WHEREAS**, Adoption by the County of Ste. Genevieve demonstrates their commitment to hazard mitigation and achieving the goals outlined in the *PLAN*;

**NOW, THEREFORE, BE IT RESOLVED BY THE County of Ste. Genevieve in the State of Missouri, THAT:**

Section 1. In accordance with RESOLUTION No. 10312019, the **County of Ste. Genevieve** adopts the final FEMA-Approved Plan.

ADOPTED By a vote of 3 'In Favor' and \_\_\_\_\_ 'Against', and \_\_\_\_\_ 'Abstaining', this  
31st Day of October 2019.
